## 1-1. General Introduction

Organophosphorus compounds that contain phosphorus atom as an integral part of the molecule (Scheme 1-1) have widespread use throughout the world, mainly in agriculture as insecticides, herbicides and plant growth regulators ${ }^{1}$. They have also been used in pharmaceuticals as therapeutic agents, such as echothiopate used in the treatment of glaucoma ${ }^{2}$ and sofosbuvir used in treatment of hepatitis C virus infection ${ }^{3}$. They also play an important role in organic synthesis as building blocks, such as Wittig reaction (eq 1-1), ${ }^{4}$ Horner-Wadsworth-Emmons reaction (eq 1-2) ${ }^{5}$ and so on, or as achiral or chiral ligands for transition metal-catalyzed transformations, such as Suziki-Miyaura reaction using $\mathrm{Ph}_{3} \mathrm{P}$, SEGphos as ligand (eq 1-3) ${ }^{6}\left(\right.$ Scheme 1-2). ${ }^{\text {1c, } 6}$ In addition, they also wide application in material chemistry. ${ }^{7}$ For example, Metal extractants based on phosphoryl compounds have been achieved. ${ }^{7 \mathrm{c}-7 \mathrm{~d}}$ For fire retardancy is unique feature for organophosphorus compounds, the environment benign fire retardants materials based on phosphoryl compounds have been applied. ${ }^{7 e-7 f}$

In the past, several classical synthetic approaches to form C-P have been developed ${ }^{1,8}$. The first popular of these methods are the reaction of the toxic halophosphine electrophiles with organometallic carbon
nucleophiles, such as organolithium and Grignard reagents (eq 1-4). The second popular of these methods are the reaction of metal phosphide with an organic electrophile, such as an aliphatic halide (eq 1-5). However, these methods often suffer low functional group compatibility and many step preparations of the coupling precursors. Another famous reaction is Michaelis-Arbuzov reaction, which is used widely to manufacture tons of the organophosphoryl compounds every year (eq 1-6). ${ }^{9}$ However, drawbacks of this reaction are also obvious. The use of the toxic alkyl halides and sometimes requires high temperatures and long reaction times limits its substrate scope. Moreover, the Michaelis-Arbuzov reaction generates one equiv. of low-boiling alkyl halide as a by-product, which can cause side reactions, drastically reducing reaction yield and efficiency. To solve these drawbacks, the exploration for a cleaner and more efficient preparation of organophosphorus compounds to replace these old methods is of current concerns.

\end{aligned}
$$

$\mathrm{R}^{2}=$ alkyl group; $\mathrm{X}=\mathrm{a}$ halogen atom

The addition of a phosphorus compounds bearing P-H bond to C-C double or triple bond has been developed over the last few years as it provides an atom-economical approach for the formation of a P-C bond (eq 1-7). This method has found numerous applications in synthetic organic chemistry in laboratory and also in industry. One example is industrial synthesis of dimethyl 1, 1-dimethyl-3-oxobutylphosphonate, the active substance of antiacidotic drug Dimephosphone. ${ }^{10}$ Another example involves a multi-ton synthesis of dimethyl 3-amino-3-oxopropylphosphonate, the precursor of a flame-retardant agent Pyrovatex $\mathrm{CP} .{ }^{11}$ The addition
reactions have been achieved under strongly basic amines and their derivatives, inorganic bases, radical initiators, transition metal complexes, Brønsted/Lewis acids, microwave irradiation (MWI), etc.

cat. $=$ acid, base, metal, radical initiator, MWI
$[P]=\mathrm{PH}_{3}, \mathrm{PRH}_{2}, \mathrm{PR}_{2} \mathrm{H}, \mathrm{P}(\mathrm{O}) \mathrm{R}_{2} \mathrm{H}, \mathrm{P}(\mathrm{O}) \mathrm{R}(\mathrm{OR}) \mathrm{H}, \mathrm{P}(\mathrm{O})(\mathrm{OR})_{2} \mathrm{H}$

Compared with the dangerous H-phosphines $\mathrm{R}_{2} \mathrm{PH}$ and phosphine halides $\mathrm{R}_{2} \mathrm{PX}$, Hydrogen phosphoryl compounds $\mathrm{P}(\mathrm{O})-\mathrm{H}$ are rather air- and moisture-stable. Addition, these compounds are readily available for they can be easily prepared or purchased since some $(\mathrm{RO})_{2} \mathrm{P}(\mathrm{O})-\mathrm{H}$ are industrially manufactured. Therefore, our interest is mainly focused on the hydrophosphorylation of C-C double or triple bond with $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds (Scheme 1-3). In the next section, efficient hydrophosphorylation reactions promoted by transition metal catalysts or under metal-free conditions are described.

## 1-2. Metal-catalyzed hydrophosphorylation of $\mathrm{C}-\mathrm{C}$ double or triple bond with $P(O)-H$ compounds

$\mathrm{P}(\mathrm{O})$-H compounds exist two tautomeric forms, $\mathrm{P}(\mathrm{V})$ and $\mathrm{P}(\mathrm{III})$, in equilibrium (eq 1-8). The phosphoryl tautomer $\mathrm{P}(\mathrm{V})$ predominates, presumably because of the very strong P-O double bond ${ }^{12}$. The phosphite tautomer $\mathrm{P}(\mathrm{III})$, like phosphine $\mathrm{R}_{3} \mathrm{P}$, can coordinate to metals and significantly deactivate the catalyst. ${ }^{13}$ As a result, an efficient metal-catalyzed addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to $\mathrm{C}-\mathrm{C}$ unsaturated bonds under mild conditions was first realized in 1996 by employing an uncommon $\mathrm{Me}_{2} \mathrm{Pd}\left(\mathrm{PPh}_{2} \mathrm{Me}\right)_{2}$ complex as the catalyst. ${ }^{14}$ Now, a number of highly regio- and stereoselective metal-catalyzed addition reactions have been developed.

## 1-2-1. Metal-catalyzed hydrophosphorylation of $\mathrm{C}-\mathrm{C}$ double bond with $\mathrm{P}(\mathrm{O})$-H compounds

Transition metal-catalyzed addition reactions of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to $\mathrm{C}-\mathrm{C}$ unsaturated are still limited. Using the more reactive five-membered cyclic(pinacolato) $\mathrm{P}(\mathrm{O}) \mathrm{H} \mathbf{1 a}$ as substrate, Pd -catalyzed hydrophosphorylation of alkene was only realized in $2000 .{ }^{15}$ With terminal aliphatic alkenes, the antiMarkovnikov $\beta$-adducts $\mathbf{3}$ were obtained in an almost quantitative using $\mathrm{Me}_{2} \mathrm{Pd}\left[\mathrm{Ph}_{2} \mathrm{P}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{PPh}_{2}\right]$ as a catalyst (eq 1-9). Beside palladium complexes, nickel and rhodium complexes also catalyzed the reaction. ${ }^{16}$ While, with styrene 4 , the $\alpha$-adduct 5 can be generated with more than $95 \%$ selectivity using $\mathrm{Me}_{2} \mathrm{Pd}^{2}\left(\mathrm{PPh}_{2} \mathrm{Cy}\right)$ as a catalyst (eq 1-10). The high reactivity of 1a toward alkenes can be successfully extended to the additions to allenes $\mathbf{6}^{17 \mathrm{a}}$ and conjugated dienes $\mathbf{8}^{17 \mathrm{~b}}$. The valuable intermediates allylphosphonates 7 and $\mathbf{9}$ was obtained through the 1,2 -addition of $\mathbf{1 a}$ to $\mathbf{6}$ (eq 1-11) and 1,4-addition of $\mathbf{1 a}$ to $\mathbf{8}$ (eq 1-12), respectively. The above addition reaction to norbornenes using a sterically bulky josiphos ligand 11 and styrene $\mathbf{4}$ using $(R, S)$-Binaphos ligands was also used in Pd-catalyzed asymmetric hydrophosphorylation to give optically active phosphonates 12 (eq 1-13) and 13 (eq 1-14), respectively. ${ }^{18}$ The asymmetric addition by using chiral ligands and diethylzinc was reported (eq 1-15). ${ }^{19}$

Radical addition of alkenes with $\mathrm{P}(\mathrm{O})$ - H compounds have been explored. A very nice and efficient radical hydrophosphonylation was reported by Ishill and coworkers using $\mathrm{Mn}(\mathrm{OAc})_{2}$ in air (eq 1-16). ${ }^{20 \mathrm{a}}$ Following the work of Ishill, the reactions of different $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to terminal alkenes, internal alkenes and styrene and its derivatives under similia conditions have been reported by other researchers. ${ }^{20}$ Silver salts are also
efficient radical initiator for the radical hydrophosphorylation of unactivated alkenes (eq 1-17). ${ }^{21}$

$32 \% \sim 80 \%$ yield

## 1-2-2. Metal-catalyzed hydrophosphorylation of C-C triple bond with $\mathbf{P}(\mathbf{O})$-H compounds

A much larger number of studies have been published on the metal-mediated addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to alkynes. These reactions give the opportunity to change the regio-and stereoselectivity of the addition products depending on the metal and ligand employed. The common $\operatorname{Pd}\left(\mathrm{Ph}_{3}\right)_{4}$ complex catalyzed the addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H} 14$ a to 1 -octyne 15a to give the corresponding anti-Markovmikov $(E)$ - $\beta$-adducts 16 with 96/4 regioselectivety (eq 1-18). ${ }^{22}$ The regioselectivity of the addition reaction was greatly affected by a small amount of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O})(\mathrm{OH})$. Markovnikov-type $\alpha$-adduct 17 was generated with high selectivity by carrying out the palladium-catalyzed $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ additions to alkynes in the presence of a small amount of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O})(\mathrm{OH})(\mathrm{eq}$ $1-19) .{ }^{23}$ When rhodium catalysts were used, 16 could be selectively obtained (eq 1-20). ${ }^{24}$ When cheap Ni complexes catalyzed the addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to alkenes, the 16 and 17 were generated efficiently and selectively by slightly adjusting the phosphine ligands and the solvent (eq 1-21). ${ }^{25}$ Later, a copper-catalyzed addition was also reported. ${ }^{26}$ When propargyl alcohols 18 were used as the substrates, wide range of products were generated and products distribution often depends upon the metal catalyst and additives. ${ }^{27}$ Using a Ni catalysts in ethanol, the addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to propargyl alcohols generated anti-Markovnikov adducts $\mathbf{1 9}$ at room temperature. When the reaction was carried out in THF in the presence of $10 \mathrm{~mol} \% \mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{OH}, 1,3-$ dienyl-2-phosphine oxides 20 were obtained in moderate to excellent yield (eq 1-22). ${ }^{27 \mathrm{a}}$ A double phosphinylation reaction of propargyl alcohol with $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ catalyzed by diruthenium complex was reported. ${ }^{27 \mathrm{~b}}$ Using $\mathrm{Zn}(\mathrm{OTf})_{2}$ as a catalyst, the phosphinylation of propargylic alcohol generated $\gamma$ ketophosphine oxides 22 (eq 1-22). ${ }^{27 \mathrm{c}}$

14a 15a
$(E)-\beta$-adducts, $16 \quad \alpha$-adducts, $\mathbf{1 7}$
$\mathbf{1 6 / 1 7}=7 / 93 \sim 2 / 98$

$\mathrm{R}^{1}=p-\mathrm{CH}_{3}-\mathrm{Ph}, p-\mathrm{Cl}-\mathrm{Ph}, \mathrm{OEt}$
$\mathrm{R}^{2}=\mathrm{Ar}$, alkyl, $\mathrm{R}^{3}=\mathrm{Ar}$

Contrary to the above-mentioned Pd -catalyzed $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ additions which gave anti-Markovnikov adducts, the Pd-catalyzed hydrophosphorylation of alkyne with H-phosphonates $(\mathrm{RO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ gave high yields of Markovnikov adducts $\mathbf{2 5}$ with up to 96/4 regioselectivity (eq 1-24). ${ }^{22}$ This reaction is applicable to variety of alkynes. Although this reaction provides a new way for the preparation of the useful branch alkenylphosphonates, the reaction conditions are far from practically useful because a special Pd complex $\mathrm{Me}_{2} \mathrm{Pd}\left(\mathrm{PPh}_{2} \mathrm{Me}\right)_{2}$ and too much of the catalyst ( $3 \mathrm{~mol} \%$ ) were used. Later, this reaction was optimized. ${ }^{28} \mathrm{By}$ using a chelating phosphine $\mathrm{Ph}_{2} \mathrm{P}\left(\mathrm{CH}_{2}\right)_{\mathrm{n}} \mathrm{PPh}_{2}(\mathrm{n}=3$ or 4$)$, high yields of the product 25 could be obtained in the presence of $0.5 \mathrm{~mol} \%$ Pd catalyst. Moreover, the combination of these phosphine with a commercially available palladium sources such as $\mathrm{Pd}(\mathrm{OAc})_{2}$ and $\mathrm{Pd}_{2}(\mathrm{dba})_{3}$ also equally works well with a palladium loading less than $0.05 \mathrm{~mol} \%$ to generate the addition products in high yields. In addition, an efficient Ni-catalyzed highly regio- and seteroselective hydrophosphorylation of alkynes at room temperature was also developed (eq 1-25). ${ }^{25}$ By slightly adjusting the reaction conditions, $\beta$ - and $\alpha$-adducts 24 and 25 was obtained with high selectivity. The (pinacolato) $\mathrm{P}(\mathrm{O}) \mathrm{H}$ 1a, which showed more reactive than other H-phosphonates in metalcatalyzed hydrophosphorylation of alkenes, can add to alkynes at room temperature using rhodium catalysts to produce the anti-Markovnikov adducts 26 with high selectivity (eq 1-26). ${ }^{29}$ By using 1a as the substrate, palladium-catalyzed dehydrogenative cis double phosphorylation of terminal alkynes affording (Z)-bisphosphoryl-1-alkenes 27 could be achieved (eq 1-27). ${ }^{30}$ Notably, an H-spirophosphorane (pinacolato) ${ }_{2} \mathrm{PH}$ 28 could be added to alkynes catalyzed by $\mathrm{Pd}(\mathrm{OAc})_{2}$ efficiently generating the Markovnikov-type addition products 29 with high selectivity (eq 1-28). ${ }^{31}$ Products 28 can be easily converted to the corresponding alkenylphosphonates and phosphonic acids through a simple hydrolysis or thermal decomposition (eq 1-29,30).

Being similar to $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$, H - Phosph inates $\mathrm{Ph}(\mathrm{RO}) \mathrm{P}(\mathrm{O}) \mathrm{H}$ adds to alkynes to give the $\alpha$ - and $\beta$-adducts $\mathbf{3 5}$ and 36 selectively under different catalyst conditions (eq 1-31). ${ }^{32}$ A nickel catalyst efficiently catalyze the addition of $\mathrm{Ph}(\mathrm{EtO}) \mathrm{P}(\mathrm{O}) \mathrm{H}$ to alkynes to produce the desired adducts $\mathbf{3 5}$ and $\mathbf{3 6}$ regio- and stereoselectively (eq $1-32) .{ }^{25} \mathrm{Cu}$-catalyzed reaction of $\mathrm{Ph}(\mathrm{EtO}) \mathrm{P}(\mathrm{O}) \mathrm{H}$ with alkynes giving $\beta$-adducts. ${ }^{26 \mathrm{a}}\left(R_{\mathrm{p}}\right)$-phenylphosphinate $\mathbf{3 4 b}$, a white solid easy to prepare and handle, could take place the Pd-catalyzed sterospecific hydrophosphinylation of alkynes to give $\alpha$-adducts ( $R_{\mathrm{p}}$ ) $\mathbf{3 7}$ with stereoretention (eq 1-33). ${ }^{33}$ While using rhodium as a catalyst, an optically $(E)-\beta$-adducts $\left(R_{\mathrm{p}}\right)$-38 was obtained by carrying out the addition of $\left(R_{\mathrm{p}}\right)-\mathbf{3 4 b}$ to alkynes (eq 1-34). ${ }^{34}$ The corresponding adducts is a versatile intermediate, which can be readily converted to other P-chiral compounds by simple several operations. ${ }^{35}$

After a comprehensive study on the palladium-catalyzed hydrophosphorylation of alkynes with $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds, Chen and co-workers draw an overall general catalytic cycle of palladium-catalyzed hydrophosphorylation (Scheme 1-3). ${ }^{24 \mathrm{e}}$ At first, alkynes were coordinated to palladium (0) to generate intermediate $\mathbf{I}$. For $(\mathrm{EtO})_{2} \mathrm{P}(\mathrm{O})-\mathrm{H}$, it reacts with intermediate $\mathbf{I}$ like an Brønsted acid to produce the internal intermediate III via hydropalladation which then produces the $\alpha$-adducts $\mathbf{1 7}$ selectively. On the other hand, for
$\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ and $\mathrm{Ph}(\mathrm{RO}) \mathrm{P}(\mathrm{O}) \mathrm{H}$, they produce a mixture of internal alkenylpalladium complexes III and terminal alkenylpalladium complexes IV, and consequently give a mixture of the adducts $\mathbf{1 7}$ and $\mathbf{1 6}$. In the presence of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{OH}$, hydropalladation of alkynes with this acid takes place first to give and internal alkenylpalladium II. A ligand exchange of this complex with a $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compound gives the internal phosphorylpalladuim intermediate III which produces the $\alpha$-adduct via reductive elimination.

Scheme 1-3. Mechanism for the palladium-catalyzed addition of $\mathrm{P}(\mathrm{O})$-H compounds to alkynes

$[P(O)]-\mathrm{H}: \mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}, \mathrm{Ph}(\mathrm{EtO}) \mathrm{P}(\mathrm{O}) \mathrm{H}$

By using the right catalyst, $\alpha$-adducts and $\beta$-adducts can be efficiently prepared with high selectivity form the metal-mediated hydrophosphorylation of alkenes and alkynes. However, it should be remained that the metal-mediated additions of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to $\mathrm{C}-\mathrm{C}$ double bonds are still far from general comparing with the metal-mediated additions of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to $\mathrm{C}-\mathrm{C}$ triple bonds. When alkynes bearing bulky substituent such as 3,3-dimethyl-1-butyne and propargyl alcohols are used, $\alpha$-adducts is usually accompanied
by $\beta$-adducts which can even become the major product (eq 1-22). In addition to substrate limitations, the purification of the adducts by conventional silica gel column chromatography is a challenge, because of the structural of phosphine oxides, formed by the air-oxidation of the phosphine ligands of the catalysts, are similar to the adducts. Furthermore, the strong coordination of the products with the transition metals hampered the application of these methods, especially in pharmaceutical industry. Hence, a metal-free hydrophosphorylation of carbon-carbon unsaturated bonds with hydrogen phosphoryl compounds is highly desirable.

## 1-3. Metal-free hydrophosphorylation of C-C double or triple bond with $\mathbf{P}(\mathbf{O})$-H compounds

## 1-3-1. Metal-free hydrophosphorylation of C-C double bond with $\mathbf{P}(\mathbf{O})$-H compounds

The conjugate addition of a phosphorus nucleophile to an electron deficient species, namely the phosphaMichael addition, is an attractive strategy for the formation of the P-C bonds. In the presence of base, the equilibrium is likely to favor the phosphite tautomer, which is a nucleophilic form (eq 1-8). ${ }^{36}$ This reaction has been promoted by guanidine bases, such as Tetramethylguanidine (TMG), ${ }^{37 \mathrm{a}, 37 \mathrm{~b}}$ pentamethylguanidine (PMG) ${ }^{37 \mathrm{c}}$ heptamethylbiguanide (HMB), ${ }^{37 \mathrm{c}}$ 1,5,7-triazabicyclo[4.4.0]dec-5-ene (TBD), ${ }^{37 \mathrm{a},}{ }^{37 \mathrm{~d}}$ 7-methyl-1, 5, 7-Triazabicyclo[4.4.0]dec-1-ene (MTBD), ${ }^{37 \mathrm{a}}$ 1, 8-diazabicyclo[5.4.0]undec-7-ene (DBU), ${ }^{37 \mathrm{e}}$ due to their high $p \mathrm{~K}_{\mathrm{a}}$ values. The typical substrates for hydrophosphorylation of C - C double bond are $\alpha, \beta$-unsaturated esters, nitroalkenes (eq 1-35). The asymmetric addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to electron-deficient alkenes by chiral organocatalysts for synthesis of chiral phosphoryl compounds have been achieved (eq 1-36). ${ }^{38}$ Since tertiary amines can efficiently promoted the addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to electron-deficient alkenes, tertiary phosphine, as expected, could also catalytic the addition (eq 1-37, 38, 39). ${ }^{39}$ Trimethylsilyl chloride promoted the addition reaction through a silicon phosphite esters intermediate (eq 1-40). ${ }^{40}$ The microwave promoted addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to terminal and internal alkenes under solvent-free conditions without a catalyst or radical initiator has reported (eq 1-41). ${ }^{41}$

The preparation of alkylphosphine oxides by the radical induced addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to $\mathrm{C}-\mathrm{C}$ unsaturated bonds has been described. The radical addition using di-t-butyl peroxide (eq 1-42), ${ }^{42 a}$ air (eq 143), ${ }^{42 \mathrm{~b}}$ AIBN (eq 1-44) ${ }^{42 \mathrm{c}}$ and $4,4^{\prime}$-azobis(4-cyanovaleric acid) (ABCVA) (eq 1-45) ${ }^{42 \mathrm{~d}}$ as the radical initiator has been achieved. Other photo-initiator such as 2,2-dimethoxy-2-phenylacetophenone (DPAP) (eq 1-46), ${ }^{43 \mathrm{a}, \mathrm{b}}$ Rhodamine $\mathrm{B}^{43 \mathrm{c}}$ can also promote the addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to alkenes. Noteworthy is that photoinduced hydrophosphinylation of alkenes with diphenylphosphine oxide without any additives was
reported by Ogawa (1-47). ${ }^{44}$

$61 \% \sim 93 \%$ yield

## 1-3-2. Metal-free hydrophosphorylation of $\mathbf{C}-\mathrm{C}$ triple bond with $\mathbf{P}(\mathbf{O})$-H compounds

Examples for the hydrophosphorylation of alkynes under metal-free conditions are limited. First, Salin and coworkers described one example of an internal alkyne, ethyl phenylpropiolate, in their addition catalyzed by $\mathrm{Bu}_{3} \mathrm{P}$. Only the $\alpha$-addition adducts is obtained (eq 1-48). ${ }^{45}$ The second example was reported for the formation of alkenylphosphonate derivatives, which proceeds through radical translocation in the presence of 0.5 equiv. DPAP under UV irradiation (eq 1-49). ${ }^{43 b}$

These addition of $\mathrm{P}(\mathrm{O})$ - H compounds to $\mathrm{C}-\mathrm{C}$ triple bonds are far from common. The first reason is that the reactivity of alkynes is less than alkenes. alkynes could self-polymerize is the second reason. In order to prevent self-polymerization, a large excess of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds was used (eq 1-49).

## 1-4. Survey of This Thesis

The hydrophosphorylation of C-C double or triple bands with $\mathrm{P}(\mathrm{O})$-H comounds under metal-free conditions have attracted attention as environmentally friendly processes. However, the development of new convenient synthetic methods for tis reaction remains a great challenge. In connection with our ongoing effects to develop new convenient synthetic methods for forming P-C bond, we studied the hydrophosphorylation of alkenes and alkynes with variety of hydrogen phosphoryl compounds under metal-free condition. Thus, in this study, I tried to expand the scope of hydrophosphorylation of alkenes and alkynes with various $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds under metal-free conditions: (1) by using $\mathrm{Me}_{3} \mathrm{P}$ as a catalyst, the addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds including H-phosphine oxide, H-phosphinate and H-phosphonate to electron-deficient alkenes took place efficiently generating 1 to 1 and 1 to 2 adducts in highly total yield and (2) H-phosphine oxide and related compounds added to alkynes producing the corresponding alkenylphosphine oxide with $Z$-isomer as the major product.

In Chapter 2, I disclosed an efficient addition of hydrogen phosphoryl compounds to electron-deficient alkenes to obtained 1 to 1 adducts and 1 to 2 adducts using $\mathrm{Me}_{3} \mathrm{P}$ as the catalyst (eq 1-50). The primary advantage using $\mathrm{Me}_{3} \mathrm{P}$ as a catalyst is the easy purification of the products because $\mathrm{Me}_{3} \mathrm{P}$ (and its phosphine
oxide) can be easily removed from the products under vacuum. It was note that the formation of the 1 to 2 adducts has rarely been recognized so far in such additions of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to electron-deficient alkenes. The hydrophosphoylation of electron-deficient alkenes with $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds successfully generated selectivity 1 to 1 adducts in high yields when $t-\mathrm{BuOH}$ was used as the solvent. However, despite an extensive survey on the reaction conditions, such as solvent, other phosphine catalysts, additives and so on, the selective formation of 1 to 2 adducts has not been achieved yet. Therefore, the generation of 1 to 2 adducts was always accompanied by the formation of 1 to 1 adducts. Using $\mathrm{Me}_{3} \mathrm{P}$ as catalyst, terminal alkenes with different electron-withdrawing groups successfully reacted with H-phosphonates, H-phosphinates and H-phosphine oxides in THF to give good to excellent total yields of the adducts. Based on several control experiments, a tentative reaction mechanism was proposed. It was concluded that the combination of acrylonitrile with $\mathrm{Me}_{3} \mathrm{P}$ can significantly deactivate the catalytic of $\mathrm{Me}_{3} \mathrm{P}$ and the long-believed zwitterionic species by the addition of $\mathrm{M}_{3} \mathrm{P}$ to acrylonitrile was not involved.

1 to 2 adducts

In Chapter 3, I studied the photo-initiated and radical initiator-induced hydrophosphorylation of terminal alkynes with H -phosphine oxides and related compounds generating alkenylphosphine oxides (eq 1-51). A mixture of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ and 1-octyne was sealed in a Pyrex glass tube and irradiated by high-pressure Hg lamp for 4 h to produce a mono-addition product as a $Z$ - and $E$ - isomer mixture and a side product by the double addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to 1-octyne. The formation of the side product could be negligible by carrying out the reaction in a dilute solution and a suitable ratio of the two starting materials. A variety of aliphatic terminal alkynes was used as the substrates to produce the corresponding alkenylphosphoryl compounds in moderate to good yields under optimal reaction conditions. The conjugated alkynes and internal alkynes hardly produced the adducts under current conditions, and most of the starting materials remained unreacted. The reactivity of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds roughly follows a decreasing order of H -phosphine oxide $>\mathrm{H}$-phosphinate $>\mathrm{H}-$
phosphonate. $\mathrm{Ph}_{2} \mathrm{PH}$ could also be used as the substrate to produce the corresponding alkenylphosphines in good yields. The $Z$ - and $E$-isomer configuration of the synthesized compounds was assigned on the basis of ${ }^{1} \mathrm{H}$-NMR spectra. The coupling constants of the alkenyl protons $\left(J_{\mathrm{HH}}\right)$ as well as that of $J_{\mathrm{PH}}$ allow the assignments of the $Z$ and $E$ isomers. A possible mechanism for this photo-induced hydrophosphorylation of terminal alkynes was proposed. The ratio of the $Z$ - and $E$-isomers was determined by the stability and reactivity of the alkenyl radicals which exists in an equilibrium of trans and cis forms. The steric hindrance of the substituent of alkynes and phosphoryl compounds can efficiently affect the ratio of $Z$ - and $E$ - adducts. It was assumed that since silyl and OH groups may interact with the phosphoryl group to stabilize the cis-form radical, which consequently generated the $Z$-adducts as the major isomer form these bulky alkynes. As to the radical initiators, AIBN (Azobisisobutyronitrile), V-70 [2,2'-azobis(4-methoxy-2,4-dimethylvaleronitrile)] and V-601 [dimethyl 2,2'-azobis(isobutyrate)] were also effective in this hydrophosphoryl reaction, and good yields of the mono addition products with high $Z / E$ selectively were obtained.

Finally, the application of these phosphoryl compounds was investigated. It was found that when diethyl benzylphosphonate was mixed with 1.5 equiv. sodium tert-butoxide under dioxygen atmosphere in anhydrous DMF at room temperature, an almost quantitative yield of trans-stilbene was obtained (eq 1-52). This reaction is a very convenient way for the synthesis of symmetrical stilbenes since the products are readily isolated by simply washing away the water-soluble phosphonate salts with water. Having established the optimal reaction conditions, the reaction was carried out using benzylic phosphonate bearing variety of substituents as substrates. Good to excellent yields of symmetrical trans-stilbene derivatives were obtained. Notably, in all cases, the reaction was highly selective for the formation of the trans-stilbene derivatives, and cis-stilbene derivatives were not detected from any of the examples as confirmed by GC and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectroscopies. A possible oxidative dephosphorylation coupling reaction mechanism was proposed. The peroxide intermediate was confirmed by the successful isolation of (1-hydroperoxybutyl) diphenylphosphine oxide. In addition, the
corresponding ketones were obtained in high yield from $\alpha$-substituted benzyl phosphonates.

## Chapter 2. Me3P-catalyzed Addition of Hydrogen Phosphoryl Compounds $\mathbf{P}(\mathbf{O}) \mathrm{H}$ to Electron-deficient Alkenes: 1 to 1 vs 1 to 2

## Adducts

## 2-1. Introduction.

During the past decades, tertiary phosphines have emerged as versatile catalysts for a wide variety of synthetically transformations for electron-deficient C-C unsaturated bonds. ${ }^{1}$ In many cases, tertiary phosphines show divergent catalytic behavior for their stronger nucleophilic properties with weaker basic character and potential to form zwitterionic species intermediate. The zwitterionic species which formatted between tertiary phosphines and electron-deficient alkenes is the starting point of the Morita-Baylis-Hillman reaction ${ }^{1 \mathrm{f}, 2}$ and Rauhut-Currier reaction ${ }^{3}$ (Scheme 2-1). As shown in Scheme 2-1, the subsequent 1, 2-addition of zwitterion intermediate to aldehyde and a proton transformation furnished the Morita-Baylis-Hillman adducts, while a conjugate addition to another molecular alkene is the Rauhut-Currier reaction.

Scheme 2-1. Morita-Baylis-Hillman reaction and Rauhut-Currier reaction based on tertiary phosphines activation

Recently, we and others reported that tertiary phosphines can efficiently catalyzed the addition of a variety of hydrogen phosphoryl compounds to electron-deficient alkenes to produce the corresponding phosphoryl compounds in high yields. ${ }^{4}$ Kim and co-workers reported tributylphosphine catalyzed addition of dialkyl phosphite to various electron-deficient alkenes to produce alkylphosphinates in good yields (eq. 2-1). ${ }^{4 \mathrm{a}}$ The
use of methyl- and ethyl acrylate and acrylonitrile afforded the corresponding phosphonates in good yield (78$82 \%$ ) in the presence of $5 \mathrm{~mol} \% \mathrm{n}-\mathrm{Bu}_{3} \mathrm{P}$ for 1 h . When other electron-deficient alkenes were used, longer reaction time ( 20 h ) was required even in the presence of $10 \mathrm{~mol} \% n^{-}$- $\mathrm{Bu}_{3} \mathrm{P}$. For the steric effect, $\beta$-substituted vinyl compounds could not be used as substrates in this protocol.

Salin and co-workers have also presented the conjugate addition of dialkyl phosphites and ethyl phenylphosphinate to electron-deficient alkenes in the presence of $\mathrm{Bu}_{3} \mathrm{P}$ to afforded corresponding phosphonates and phosphinates in high yields (eq. 2-2). ${ }^{4 \mathrm{~b}, 4 \mathrm{c}}$ When methyl acrylate and acrylonitrile were used as substrate, $5 \mathrm{~mol} \%$ of $\mathrm{Bu}_{3} \mathrm{P}$ was enough to afford the corresponding products in high yield over a 0.5 h period. However, $20-70 \mathrm{~mol} \%$ of the $\mathrm{Bu}_{3} \mathrm{P}$ was required for acrylamide and $\alpha$-substituted acrylate to furnish corresponding adducts in good to excellent yields within short reaction time.

Salin and co-workers developed $\mathrm{Bu}_{3} \mathrm{P}$-catalyzed addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to ethyl phenylpropiolate (eq. 2-3). ${ }^{4 \mathrm{~d}} \mathrm{Bu}_{3} \mathrm{P}(30 \mathrm{~mol} \%)$ was used to promote the addition of various dialkyl phosphites and ethyl phenylphosphinate to ethyl phenylpropiolate in MeCN to afford the more thermodynamically stable $E$ isomeric products in good yields with $E / Z$ ratios of at least 95:5.

In 2015, our team reported a convenient and versatile method for the preparation of 1,2bisphosphorylethanes by using $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds and vinylphosphoryl compounds under $\mathrm{Me}_{3} \mathrm{P}$-catalyzed conditions (eq. 2-4). ${ }^{4 \mathrm{e}}$ Under optimal conditions, the $\mathrm{Me}_{3} \mathrm{P}$-catalyzed addition reaction can be readily applied to various substrates to produce the corresponding bisphosphorylethanes in high yield.

Later, our team reported $\mathrm{Me}_{3} \mathrm{P}$-catalyzed addition of optically active compounds to electron-deficient alkenes to produce the corresponding $P$-stereogenic adducts in high yields and excellent d.r.c (eq. 2-5). ${ }^{4 \mathrm{f}}$

$\mathrm{EWG}=\mathrm{P}(\mathrm{O})\left(\mathrm{OEt}_{2}\right), \mathrm{P}(\mathrm{O})(\mathrm{OMe})_{2}, \mathrm{P}(\mathrm{O}) \mathrm{Ph}_{2}, \mathrm{P}(\mathrm{O})(\mathrm{OEt}) \mathrm{Ph}$,

$$
\mathrm{P}(\mathrm{O}) \mathrm{Ph}[(-) \mathrm{MenO}]\left(R_{\mathrm{p}}\right), \mathrm{CN}, \mathrm{CO}_{2} \mathrm{Me},
$$

In addition to its high efficiency, the primary advantage using $\mathrm{Me}_{3} \mathrm{P}$ as a catalyst, compared with other
catalysts such as the metal-catalysts, ${ }^{5}$ is the easy purification of the resulted products because the $\mathrm{Me}_{3} \mathrm{P}$ catalyst (and its corresponding phosphine oxide $\mathrm{Me}_{3} \mathrm{P}(\mathrm{O})$ ) can be easily removed under vacuum from the products.

A further study on the synthetic potential of this $\mathrm{Me}_{3} \mathrm{P}$-catalyzed addition by changing the vinylphosphoryl compounds to other $\mathrm{CH}_{2}=$ CHEWG ( $\alpha, \beta$-unsaturated esters and nitriles), interestingly revealed that, in addition to the expected 1 to 1 (one molecule $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compound with one molecule olefin) adduct 41, a novel 1 to 2 (one molecule $\mathrm{P}(\mathrm{O})$-H compounds with two molecules olefin) adduct $\mathbf{4 2}$ was also generated (eq. 2-6). Noteworthy is that it seems that such an adduct $\mathbf{4 2}$ has not been recognized before in such addition reactions of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to an electron-deficient alkene. ${ }^{6}$ Here below we report the details.

## 2-2. Results and Discussion

To a mixture of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H} \mathbf{3 9 a}(1.0 \mathrm{mmol})$ and acrylonitrile $\mathbf{4 0 a}(2.0 \mathrm{mmol})$ in $\mathrm{THF}(1.0 \mathrm{~mL})$ was added $\mathrm{Me}_{3} \mathrm{P}\left(0.05 \mathrm{mmol}, 1.0 \mathrm{~mol} / \mathrm{L}\right.$ in THF) at $0{ }^{\circ} \mathrm{C}$. The cooling ice bath was then removed and the solution was stirred at room temperature for 1 h . GC analysis showed that $97 \%(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ was consumed and the adduct 41a ( 1 to 1 adduct) by the addition of one molecule $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to one molecule acrylonitrile and 42a (1 to 2 adduct) by the addition of one molecule $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to two molecules acrylonitrile were generated in $69 \%$ and $28 \%$ yields, respectively (eq 2-7). ${ }^{7}$

Although the formation of the 1 to 1 adduct 41a is somewhat a result within prediction, as mentioned above, the formation of the 1 to 2 adduct 42a was rather unexpected, i.e. it seems this is the first time to reveal its formation in such addition reactions of $\mathrm{P}(\mathrm{O}) \mathrm{H}$ compounds. ${ }^{6}$ In order to selectively obtain the two adducts, the reaction conditions were subsequently optimized.

## 2-2-1. Selective generation of 41 .

As a model reaction, we started our optimization by conducting the addition of dimethyl phosphite to acrylonitrile in the presence of $\mathrm{Me}_{3} \mathrm{P}$ catalyst (Table 2-1). The addition reaction at room temperature in MeCN took place rapidly to produce $98 \%$ total yield of 41a/42a with a ratio of $\mathbf{4 1} \mathbf{a} / \mathbf{4 2} \mathbf{a}=70 / 30($ Table 2-1, entry 1$)$ in an hour. Stirring the reaction mixture for a longer time ( 8 h ) did not give difference in yields and ratio of the products, showing that both $\mathbf{4 1 a}$ and 42a, once formed, are stable under current conditions (entry 2 ). The reaction could also be carried out using less $\mathrm{Me}_{3} \mathrm{P}(1 \mathrm{~mol} \%)$, albeit the yield of the adducts slightly decreased (entry 3). Similarly, when 1.0 mmol acrylonitrile was used, a moderate yield of the adduct $54 \%$ (entry 4) was obtained. Interestingly, however, compared to entry 1 , the use of more acrylonitrile only has a tiny effect on the reaction (entries 5 and 6 ). On the other hand, the reaction temperature can affect the ratio of the two products 41a/42a. Thus, the selectivity to 42a constantly increased as the reaction temperature decreased (entries 7-10). The reaction also progressed rapidly in toluene, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and EtOAc (entries 11-13). However, only low yields of the products were obtained in DMF, DMSO and acetone (entries 14-16). On the other hand, no addition products were observed when the reaction was conducted in EtOH. Surprisingly, however, 3a was selectively generated in a high yield when $t$ - BuOH was used as the solvent (entry 18).

Table 2-1. Reaction condition optimization for the selective generation of 41a. ${ }^{a}$

${ }^{a}$ Reaction conditions: to a solution of dimethyl phosphite ( 1.0 mmol ) and acrylonitrile ( 2.0 mmol ) in solvent $(1.0 \mathrm{~mL})$ was added $\mathrm{Me}_{3} \mathrm{P}\left(0.05 \mathrm{mmol}, 1.0 \mathrm{~mol} / \mathrm{L}\right.$ in THF) at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 1 h . Yield was determined by GC. ${ }^{b} 8 \mathrm{~h} .{ }^{c} \mathrm{Me}_{3} \mathrm{P}(0.01 \mathrm{mmol}) .{ }^{d} 1.0 \mathrm{mmol}$ acrylonitrile was used. ${ }^{e} 3.0 \mathrm{mmol}$ acrylonitrile was used. ${ }^{f} 4.0 \mathrm{mmol}$ acrylonitrile was used. ${ }^{g}$ at $0^{\circ} \mathrm{C} .{ }^{h}$ at $-40^{\circ} \mathrm{C} .{ }^{i}$ at $-60{ }^{\circ} \mathrm{C}$.

Next, in order to clarify the scope and limitations of this reaction, the additions of a variety of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to electron-deficient alkenes under this optimized reaction condition (entry 18) were carried out. As shown in Table 2-2, all the dialkyl phosphites tested could produce the corresponding products in good
yields with excellent selectivity to the 1 to 1 adduct 41 (Table 2-2, products 41a-41e). H-phosphinate isopropyl phenylphosphinate and secondary phosphine oxide diphenylphosphine oxide were also applicable to this reaction, generating the corresponding 1 to 1 adducts in high yield with high selectivity (41f, 41g). The electron-deficient methyl acrylate and tert-butyl acrylate were found as reactive as acrylonitrile to react with dimethyl phosphite, furnishing the expected products $\mathbf{4 1}$ in high yields (products $\mathbf{4 1 h}, \mathbf{4 1 i}$ ). The steric methyl acrylonitrile and methyl methacrylate also worked well under the present reaction conditions and the desired products were given in high yields (products $\mathbf{4 1 j}, \mathbf{4 1 k}$ ).

## 2-2-2. Attempted selective generation of 42 .

Since the 1 to 1 addition product 41 was successfully generated selectively, we turned our attention to the selective generation of $\mathbf{4 2}$. As described in Table 2-1, the selective generation of $\mathbf{4 2}$ was not achieved under the conditions of Table 2-1. Therefore, we decided to further optimize the conditions in order to selectively
obtain 42 (Table 2-3). The addition also took place readily with methyl acrylate (entries 1 and 2). Similar to acrylonitrile, when 1.0 equivalence was used, $52 \%$ yield of the adducts with a ratio of $\mathbf{4 1 \mathbf { h }} / \mathbf{4 2 h}=60 / 40$ was obtained (entry 1). With 2.0 equivalents of methyl acrylate, $96 \%$ yield of the adducts was obtained, albeit the ratio of the adducts changed little $(\mathbf{4 1 h} / \mathbf{4 2 h}=58 / 42)$ (entry 2$)$. The addition also took place smoothly with the bulky diisopropyl phosphosite to give $88 \%$ yield of the adducts $\mathbf{4 1} \mathbf{c} / \mathbf{4 2} \mathbf{c}$ with $65 / 35$ selectivity (entry 3 ). In addition to $\mathrm{Me}_{3} \mathrm{P}$, the reaction could also be catalyzed efficiently by other trialkyl phosphines $\mathrm{Et}_{3} \mathrm{P}, n-\mathrm{Bu}_{3} \mathrm{P}$ and even the very bulky $t-\mathrm{Bu}_{3} \mathrm{P}$ and $\mathrm{Cy}_{3} \mathrm{P}$ (entries 4-7). Dimethylphenylphosphine also well catalyzed the addition (entry 8). However, the bulky dicyclohexylphenylphoshine only gave a low yield of the products under similar conditions (entry 9). The catalytic activity of diphenylmethylphosphine was also low (entry 10), while triarylphosphines like $\mathrm{Ph}_{3} \mathrm{P},\left(p-\mathrm{MeC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{P},\left(p-\mathrm{MeO}-\mathrm{C}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{P}$ all could not catalyze the addition reaction (entries 11-13). When we used triethylamine ( $\mathrm{p} K_{a}=10.75$ ), which higher basicity than trimethylphosphine $\left(\mathrm{p} K_{a}=8.65\right),{ }^{8}$ as catalyst under current conditions, the reaction was failed (entry 14). Very interestingly, however, with a combination of these inactive phosphine and $\mathrm{Et}_{3} \mathrm{~N}$, the addition could also take place (entries 15 and 16). Thus, the combination of $\left(p-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{P}$ gave $16 \%$ total yield of the adducts (entry 15$)$, and the combination of $\mathrm{Cy}_{2} \mathrm{PhP}$ with $\mathrm{Et}_{3} \mathrm{~N}$ gave $42 \%$ total yield of the adducts (entry 16). As expected, the triarylphsophine having an amino group $\left(p-\mathrm{Me}_{2} \mathrm{NC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{P}$ could also catalyze the reaction (entry 17). However, despite such an extensive study on the reaction, the selective formation of $\mathbf{4 2}$ has not been found yet.

${ }^{a}$ Reaction conditions: phosphine $(1.0 \mathrm{mmol})$, alkene ( x mmol), catalyst $(0.05 \mathrm{mmol})$, solvent $(1.0 \mathrm{~mL}), 25^{\circ} \mathrm{C}$, 1h. ${ }^{b}$ Equivalent alkene. ${ }^{c}$ Total GC yield of 41 and $42 .{ }^{d}$ Ratio of $\mathbf{4 1} / 42 \mathrm{GC}$ yield. ${ }^{e} \mathrm{THF}$ as solvent. ${ }^{f} \mathrm{MeCN}$ as solvent.

As summarized in Table 2-4, in addition to $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$, other dialkylphosphites $(\mathrm{RO}){ }_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}(\mathrm{R}=\mathrm{Et}$, $n-\mathrm{Bu}, i-\mathrm{Pr}, \mathrm{PhCH}_{2}$ ) also reacted readily to give the products in high yields (Table 2-4, products 41b-41e and 42b-42e). Not limited to dialkyl phosphite, isopropyl phenylphosphinate (products 41f and 42f), and diphenylphosphine oxide (products $\mathbf{4 1 g}$ and $\mathbf{4 2 g}$ ) could also be used as the substrates to give the corresponding adducts in high yields.

In addition to acrylonitrile, satisfactory results were also obtained in the reaction of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ with several acrylates such as methyl acrylate (products $\mathbf{4 1 h}$ and 42h), tert-butyl acrylate (products 41i and 42i), methyl acrylonitrile (products $\mathbf{4 1 j}$ and $\mathbf{4 2 j}$ ), and methyl methacrylate (products $\mathbf{4 1 k}$ and $\mathbf{4 2 k}$ ), in $73 \%$ to $95 \%$
yields. Good results were also obtained with isopropyl phenylphosphinate and methyl acrylate (products 411 and 421). Diphenyl phosphine oxide also served well to react with acrylates, producing the products in high yields (products $\mathbf{4 1 m} \mathbf{- 4 1 p}$ and $\mathbf{4 2 m - 4 2 p}$ ). It is worth noting that under the reaction conditions, the 1 to 1 adducts $\mathbf{4 1 k}$ and 41p were obtained selectively (products $\mathbf{4 1 k}$ and 41p). Methyl vinylketone also could be used as the substrate to give the 1 to 1 adduct $\mathbf{4 1 q}$ and $\mathbf{4 1} \mathbf{r}$ predominantly. The two adducts could be separated and isolated in pure form by conventional techniques. All these compounds we obtained have been fully characterized spectroscopically as shown in the experimental section.

## 2-2-3. Mechanistic study.

To gain some insights into the reaction mechanism, a series of control experiments were carried out (Scheme 2-1). It was known that acrylonitrile could dimerize to produce 2-methyleneglutaronitrile 43 (eq 28). ${ }^{9}$ Therefore, it was first thought that the addition of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to acrylonitrile should give the 1 to 1 adduct 41a (eq 2-9), while the addition to 43 should give the 1 to 2 adduct 42a (eq. 2-10). Indeed, a separate
experiment using 43 confirmed that the addition did occur to produce 42a (eq. 2-11). However, as described below, this reaction path, although could not be completely excluded out, should not be the major path for the formation of 42a under the reaction conditions.

Firstly, under the reaction conditions in the absence of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$, the dimerization product 43 from acrylonitrile in THF and $t-\mathrm{BuOH}$, was obtained in only $5 \%$ and $10 \%$ yield, respectively (eqs 2-12 and 2-13). Very surprisingly, the addition almost did not take place when $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ was subsequently added to the mixtures. On the other hand, by the addition of another $5 \mathrm{~mol} \% \mathrm{Me}_{3} \mathrm{P}$, the addition took place rapidly to give the adducts in high yields. Therefore, it can be safely concluded that the combination of $\mathrm{CH}_{2}=\mathrm{CHCN}$ with $\mathrm{Me}_{3} \mathrm{P}$ can significantly deactivate the catalytic activity of $\mathrm{Me}_{3} \mathrm{P}$ in the addition of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to $\mathrm{CH}_{2}=\mathrm{CHCN}$. However, interestingly, such a deactivation of the catalyst $\mathrm{Me}_{3} \mathrm{P}$ was not observed with the combination of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ with $\mathrm{Me}_{3} \mathrm{P}$, because the addition still took place readily when $\mathrm{CH}_{2}=\mathrm{CHCN}$ was subsequently added to the mixture of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ with $\mathrm{Me}_{3} \mathrm{P}(\mathrm{eq} 2-14)$.

${ }^{a} \mathrm{GC}$ yield.

Although a detailed mechanism is not clear, on the basis of the above results, a simplified mechanism for the $\mathrm{Me}_{3} \mathrm{P}$-catalyzed addition of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O})-\mathrm{H}$ to $\mathrm{CH}_{2}=\mathrm{CHCN}$ is proposed (Scheme 2-2). Dimethylphosphite and trimethylphosphine may generate an intermediate $\mathbf{I}$. This intermediate $\mathbf{I}$ adds to acrylonitrile, perhaps via an intermediate II, to give the 1 to 1 adduct 41a. On the other hand, intermediate II may add to another molecule acrylonitrile to generated III which, via a subsequent protonation, will give the 1 to 2 adduct 42a. 1 to 1 adduct 41a was major product when $t$ - BuOH as solvent since $t$ - BuOH provides the proton which can quickly quench the intermediate II. Although the addition of $\mathrm{Me}_{3} \mathrm{P}$ to acrylonitrile generating a zwitterionic species IV is also a long-proposed reasonable reaction, apparently, this is a dead path for the catalytic addition of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O})-\mathrm{H}$ to acrylonitrile as shown in eqs 12-14.

Scheme 2-2. A plausible mechanism for the $\mathrm{Me}_{3} \mathrm{P}$-catalyzed addition of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to acrylonitrile.

## 2-3. Conclusion

In conclusion, we have disclosed a simple $\mathrm{Me}_{3} \mathrm{P}$-catalyzed addition of hydrogen phosphoryl compounds $\mathrm{P}(\mathrm{O}) \mathrm{H}$ to electron-deficient alkenes to give the very useful functional phosphoryl compounds. The reaction produced not only the 1 to 1 adduct 41 but also a new type 1 to 2 adduct $\mathbf{4 2}$. The generation of the 1 to 1 adduct 41 was selective. Although a selective generation of 42 was not achieved, this adduct could be isolated via conventional techniques. The workup of the reaction mixture is very simple compared with other methods since the catalyst can be easily removed from the product under vacuum.

## 2-4. Experimental Section

General information: All materials were purchased and used without further purification. 1H NMR spectra were recorded on JEOL JNM-ESC400 (400 MHz) FT NMR in $\mathrm{CDCl}_{3}$ with $\mathrm{Me}_{3} \mathrm{Si}$ as an internal standard. ${ }^{13} \mathrm{C}$ NMR spectra were taken on JEOL JNM-ECS400 (100 MHz) FT NMR system in $\mathrm{CDCl}_{3} .{ }^{31} \mathrm{P}$ NMR spectra were taken on JEOL JNM-ECX400 (162 MHz) FT NMR system in $\mathrm{CDCl}_{3}$ with $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$
solution as an external standard. HPLC (recycle GPC) method for isolation was performed on JAPAN ANALYTICAL INDUSTRY LC-908 with JAIGEL-1H (polystyrene-based column). High resolution mass spectra were obtained on JEOL JMS700 at Kyoto-Nara Advanced Nanotechnology Network. Caution: trimethylphosphine has toxicity and high volatility. When trimethylphosphine is manipulated, ventilate the bench carefully.

General procedure for $\mathrm{Me}_{3} \mathrm{P}$ catalyzed addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to electron-deficient alkenes: A glass schlenk tube was charged with $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds ( 1.0 mmol ), electron-deficient alkenes ( 1.0 mmol ) and 1.0 mL solvent. After the tube was cooled in an ice-water bath, $\mathrm{Me}_{3} \mathrm{P}(1.0 \mathrm{~mol} / \mathrm{L}$ in THF, 0.05 mL$)$ was injected with a syringe. After stirring for 5 minutes, the ice bath was removed. The reaction mixture was warmed up to room temperature and stirred for 1 h . The solvent and $\mathrm{PMe}_{3}$ was removed under reduce pressure. The crude product was purified by GPC to get the analytically pure samples.

## Dimethyl (2-cyanoethyl)phosphonate (41a).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.54(\mathrm{~d}, J=11.2 \mathrm{~Hz}, 6 \mathrm{H}), 2.40\left(\mathrm{td}, J_{1}=8.0 \mathrm{~Hz}, J_{2}=\right.$ $15.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.87\left(\mathrm{td}, J_{1}=8.0 \mathrm{~Hz}, J_{2}=18.0 \mathrm{~Hz}, 2 \mathrm{H}\right) .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 118.0(\mathrm{~d}, J=$ $16.2 \mathrm{~Hz}), 52.2(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 21.0(\mathrm{~d}, J=144.8 \mathrm{~Hz}), 10.8(\mathrm{~d}, J=3.8 \mathrm{~Hz}) .{ }^{31} \mathrm{P} \operatorname{NMR}\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ (ppm) 29.5. This compound is known. ${ }^{11}$

## 2-((diphenylphosphoryl)methyl)pentanedinitrile (42g).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.79 \sim 7.70(\mathrm{~m}, 4 \mathrm{H}), 7.61 \sim 7.47(\mathrm{~m}, 6 \mathrm{H}), 3.20 \sim 3.11$ (m, $1 \mathrm{H}), 2.78 \sim 2.70(\mathrm{~m}, 1 \mathrm{H}), 2.63 \sim 2.44(\mathrm{~m}, 3 \mathrm{H}), 2.37 \sim 2.29(\mathrm{~m}, 1 \mathrm{H}), 2.08 \sim 1.98(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 132.8(\mathrm{~d}, J=2.8 \mathrm{~Hz}), 132.7(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 132.5(\mathrm{~d}, J=101.9 \mathrm{~Hz}), 131.0(\mathrm{~d}, J=9.5 \mathrm{~Hz})$, $130.8(\mathrm{~d}, J=100.0 \mathrm{~Hz}), 130.5(\mathrm{~d}, J=9.5 \mathrm{~Hz}), 129.2(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 129.2(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 119.3(\mathrm{~d}, J=11.4$ $\mathrm{Hz}), 117.6,32.5(\mathrm{~d}, J=67.7 \mathrm{~Hz}), 29.0(\mathrm{~d}, J=4.8 \mathrm{~Hz}), 25.2(\mathrm{~d}, J=1.9 \mathrm{~Hz}), 15.2 .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 28.7. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{18} \mathrm{H}_{17} \mathrm{~N}_{2} \mathrm{OP}: 308.1078$, Found: 308.1080

## Methyl 3-(dimethoxyphosphoryl)propanoate (41h).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.67(\mathrm{~d}, J=10.4 \mathrm{~Hz}, \mathrm{~s}, 9 \mathrm{H}), 2.57 \sim 2.50(\mathrm{~m}, 2 \mathrm{H})$, 2.07~1.99 (m, 2H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 172.4(\mathrm{~d}, J=18.1 \mathrm{~Hz}), 52.5(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 52.0$, 27.2 (d, $J=3.8 \mathrm{~Hz}$ ), 20.7 (d, $J=143.9 \mathrm{~Hz}$ ). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 33.4. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{6} \mathrm{H}_{14} \mathrm{O}_{5} \mathrm{P}: 197.0578$, Found: 197.0554. This compound is known. ${ }^{10}$

## Dimethyl 2-((dimethoxyphosphoryl)methyl)pentanedioate (42h)

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.69 \sim 3.62(\mathrm{~m}, 12 \mathrm{H}), 2.80 \sim 2.70(\mathrm{~m}, 1 \mathrm{H}), 2.31 \sim 2.15$ (m, 3H), 1.96~1.77 (m, 3H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 174.3(\mathrm{~d}, J=8.6 \mathrm{~Hz}), 172.8,52.6(\mathrm{~d}, J=$
6.6 Hz), 52.5 (d, $J=6.7 \mathrm{~Hz}), 52.1,51.7,39.1(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 31.2,28.4(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 27.7(\mathrm{~d}, J=142.0$ $\mathrm{Hz}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 31.8. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]{ }^{+} \mathrm{C}_{10} \mathrm{H}_{20} \mathrm{O}_{7} \mathrm{P}: 283.0946$, Found: 283.0927.
tert-Butyl 3-(dimethoxyphosphoryl)propanoate (41i).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.69(\mathrm{~d}, J=10.8 \mathrm{~Hz}, 6 \mathrm{H}), 2.48 \sim 2.41(\mathrm{~m}, 2 \mathrm{H})$, 2.03~1.94 (m, 2H), $1.39(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 171.1(\mathrm{~d}, J=18.1 \mathrm{~Hz}), 80.9,52.4(\mathrm{~d}$, $J=6.7 \mathrm{~Hz}), 28.4(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 27.9,20.7(\mathrm{~d}, J=143.0 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 34.0$. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{9} \mathrm{H}_{20} \mathrm{O}_{5} \mathrm{P}: 239.1048$, Found: 239.1076.

## Di-tert-butyl 2-((dimethoxyphosphoryl)methyl)pentanedioate (42i).

Colorless oil; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.69(\mathrm{~d}, J=2.4 \mathrm{~Hz}, \mathrm{~d}, J=3.2 \mathrm{~Hz}, 6 \mathrm{H}), 2.67 \sim 2.57(\mathrm{~m}$, $1 \mathrm{H}), 2.25 \sim 2.13(\mathrm{~m}, 3 \mathrm{H}), 1.86 \sim 1.69(\mathrm{~m}, 3 \mathrm{H}), 1.42(\mathrm{~s}, \mathrm{~s}, 18 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 169.1(\mathrm{~d}$, $J=7.6 \mathrm{~Hz}), 167.8,77.1,76.4,48.4(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 48.3(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 35.8(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 28.6,25.0(\mathrm{~d}, J$ $=13.3 \mathrm{~Hz}$ ), 24.0, 23.9, $23.4(\mathrm{~d}, J=142.0 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 32.6. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{16} \mathrm{H}_{32} \mathrm{O}_{7} \mathrm{P}: 367.1885$, Found: 367.1886.

## Dimethyl (2-cyanopropyl)phosphonate (41j).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.72 \sim 3.68(\mathrm{~d}, J=10.8 \mathrm{~Hz}, \mathrm{~d}, J=11.2 \mathrm{~Hz}, 6 \mathrm{H})$, $2.99 \sim 2.87(\mathrm{~m}, 1 \mathrm{H}), 2.16 \sim 2.05(\mathrm{~m}, 1 \mathrm{H}), 1.93 \sim 1.83(\mathrm{~m}, 1 \mathrm{H}), 1.39 \sim 1.37(\mathrm{~d}, J=7.2 \mathrm{~Hz}, \mathrm{~d}, J=6.0 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 121.6(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 52.7(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 52.6(\mathrm{~d}, J=6.6 \mathrm{~Hz}), 30.0(\mathrm{~d}, J$ $=142.9 \mathrm{~Hz}), 20.4(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 19.3(\mathrm{~d}, J=9.5 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR $\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ 28.7. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{6} \mathrm{H}_{13} \mathrm{NO}_{3} \mathrm{P}: 178.0633$, Found: 178.0646.

Dimethyl (2,4-dicyano-2-methylpentyl)phosphonate (42j).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.76 \sim 3.72(\mathrm{~m}, 6 \mathrm{H}), 2.88 \sim 2.80(\mathrm{~m}, 1 \mathrm{H}), 2.31 \sim 1.98(\mathrm{~m}$, $4 \mathrm{H}), 1.63 \sim 1.59(\mathrm{~s}, \mathrm{~s}, 3 \mathrm{H}), 1.41 \sim 1.39(\mathrm{~d}, J=7.2 \mathrm{~Hz}, \mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H},) ;{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ $122.2,122.1,122.0(\mathrm{~d}, J=11.4 \mathrm{~Hz}), 121.8(\mathrm{~d}, J=11.4 \mathrm{~Hz}), 52.9(\mathrm{~d}, J=6.6 \mathrm{~Hz}), 52.8(\mathrm{~d}, J=7.7 \mathrm{~Hz}), 52.7(\mathrm{~d}$, $J=5.7 \mathrm{~Hz}), 43.1(\mathrm{~d}, J=7.7 \mathrm{~Hz}), 42.9(\mathrm{~d}, J=7.7 \mathrm{~Hz}), 36.1(\mathrm{~d}, J=142.9 \mathrm{~Hz}), 33.8(\mathrm{~d}, J=142.0 \mathrm{~Hz}), 33.4(\mathrm{~d}$, $J=2.9 \mathrm{~Hz}), 33.1(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 26.3(\mathrm{~d}, J=5.7 \mathrm{~Hz}), 25.2(\mathrm{~d}, J=7.6 \mathrm{~Hz}), 22.1(\mathrm{~d}, J=26.6 \mathrm{~Hz}), 19.6(\mathrm{~d}, J=$ $16.2 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR (162 MHz, $\mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 26.5. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]+\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{P}: 245.1055$, Found: 245.1067.

## Methyl 3-(dimethoxyphosphoryl)-2-methylpropanoate (41k).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.68 \sim 3.64(\mathrm{~m}, 9 \mathrm{H}), 2.84 \sim 2.72(\mathrm{~m}, 1 \mathrm{H}), 2.28 \sim 2.18(\mathrm{~m}$, $1 \mathrm{H}), 1.81 \sim 1.70(\mathrm{~m}, 1 \mathrm{H}), 1.25(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 175.6(\mathrm{~d}, J=12.4$
$\mathrm{Hz}), 52.4(\mathrm{~d}, J=4.8 \mathrm{~Hz}), 52.0,34.3(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 29.0(\mathrm{~d}, J=141.1 \mathrm{~Hz}), 18.7(\mathrm{~d}, J=9.6 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR ( 162 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ 32.6. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{7} \mathrm{H}_{16} \mathrm{O}_{5} \mathrm{P}: 211.0735$, Found: 211.0764.

## Methyl 3-(isopropoxy(phenyl)phosphoryl)propanoate (411).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.67 \sim 7.62(\mathrm{~m}, 2 \mathrm{H}), 7.42 \sim 7.31(\mathrm{~m}, 3 \mathrm{H}), 4.59 \sim 4.34(\mathrm{~m}$, $1 \mathrm{H}), 3.47(\mathrm{~s}, 3 \mathrm{H}), 2.53 \sim 2.31(\mathrm{~m}, 2 \mathrm{H}), 2.17 \sim 1.95(\mathrm{~m}, 2 \mathrm{H}), 1.24(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 3 \mathrm{H}), 1.02(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 172.4(\mathrm{~d}, J=17.2 \mathrm{~Hz}), 132.1(\mathrm{~d}, J=1.9 \mathrm{~Hz}), 131.5(\mathrm{~d}, J=123.9 \mathrm{~Hz})$, $131.4(\mathrm{~d}, J=9.5 \mathrm{~Hz}), 128.4(\mathrm{~d}, J=12.3 \mathrm{~Hz}), 69.6(\mathrm{~d}, J=5.8 \mathrm{~Hz}), 51.6,26.4,25.8(\mathrm{~d}, J=102.0 \mathrm{~Hz}), 24.3(\mathrm{~d}$, $J=2.9 \mathrm{~Hz}), 23.7(\mathrm{~d}, J=4.8 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR $\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 41.8$. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+}$ $\mathrm{C}_{13} \mathrm{H}_{20} \mathrm{O}_{4} \mathrm{P}: 271.1099$, Found: 271.1080.

## Dimethyl 2-((isopropoxy(phenyl)phosphoryl)methyl)pentanedioate (421).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.74 \sim 7.67(\mathrm{~m}, 2 \mathrm{H}), 7.49 \sim 7.38(\mathrm{~m}, 3 \mathrm{H}), 4.48 \sim 4.37(\mathrm{~m}$, $1 \mathrm{H}), 3.56(\mathrm{~d}, J=12.4 \mathrm{~Hz}, \mathrm{~d}, J=65.2 \mathrm{~Hz}, 6 \mathrm{H}), 2.84 \sim 2.67(\mathrm{~m}, 1 \mathrm{H}), 2.42 \sim 2.18(\mathrm{~m}, 3 \mathrm{H}), 2.00 \sim 1.77(\mathrm{~m}, 3 \mathrm{H}), 1.28$ $(\mathrm{d}, J=6.0 \mathrm{~Hz}, \mathrm{~d}, J=5.6 \mathrm{~Hz}, 3 \mathrm{H}), 1.05(\mathrm{~d}, J=5.2 \mathrm{~Hz}, \mathrm{~d}, J=6.0 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $(\mathrm{ppm}) 174.4(\mathrm{~d}, J=6.6 \mathrm{~Hz}), 174.2(\mathrm{~d}, J=7.6 \mathrm{~Hz}), 172.8,172.7,132.2,132.1(\mathrm{~d}, J=124.9 \mathrm{~Hz}), 131.8(\mathrm{~d}, J=$ $10.4 \mathrm{~Hz}), 131.7(\mathrm{~d}, J=123.9 \mathrm{~Hz}), 131.6(\mathrm{~d}, J=10.5 \mathrm{~Hz}), 128.5(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 128.4(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 69.9$ $(\mathrm{d}, J=6.7 \mathrm{~Hz}), 69.8(\mathrm{~d}, J=6.6 \mathrm{~Hz}), 51.8,51.7,51.5,38.5,38.4,32.9(\mathrm{~d}, J=101.0 \mathrm{~Hz}), 32.7(\mathrm{~d}, J=101.1 \mathrm{~Hz})$, $31.2,28.7(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 28.5(\mathrm{~d}, J=11.4 \mathrm{~Hz}), 24.5(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 24.4(\mathrm{~d}, J=2.8 \mathrm{~Hz}), 23.8(\mathrm{~d}, J=4.8$
$\mathrm{Hz}) .{ }^{31} \mathrm{P}$ NMR (162 MHz, $\mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 40.7,40.3$. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]{ }^{+} \mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{6} \mathrm{P}: 357.1467$, Found: 357.1477.

## Methyl 3-(diphenylphosphoryl)propanoate (41m).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.86 \sim 7.63(\mathrm{~m}, 4 \mathrm{H}), 7.45 \sim 7.36(\mathrm{~m}, 6 \mathrm{H}), 3.53(\mathrm{~s}, 3 \mathrm{H})$, 2.59~2.47 (m, 4H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 172.6(\mathrm{~d}, J=16.2 \mathrm{~Hz}), 132.5(\mathrm{~d}, J=99.1 \mathrm{~Hz})$, $131.8(\mathrm{~d}, J=2.8 \mathrm{~Hz}), 130.6(\mathrm{~d}, J=9.6 \mathrm{~Hz}), 128.6(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 51.8,26.1(\mathrm{~d}, J=1.9 \mathrm{~Hz}), 25.2(\mathrm{~d}, J=72.9$ $\mathrm{Hz}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 32.0. This compound is known. ${ }^{12}$

## Dimethyl 2-((diphenylphosphoryl)methyl)pentanedioate (42m).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.69 \sim 7.64(\mathrm{~m}, 4 \mathrm{H}), 7.46 \sim 7.36(\mathrm{~m}, 6 \mathrm{H}), 3.53(\mathrm{~s}, 3 \mathrm{H})$, $3.35(\mathrm{~s}, 3 \mathrm{H}), 2.91 \sim 2.72(\mathrm{~m}, 2 \mathrm{H}), 2.32 \sim 2.21(\mathrm{~m}, 3 \mathrm{H}), 1.97 \sim 1.92(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ $174.3(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 172.6,133.5(\mathrm{~d}, J=99.2 \mathrm{~Hz}), 132.3(\mathrm{~d}, J=98.1 \mathrm{~Hz}), 131.8(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 131.7(\mathrm{~d}, J$ $=2.8 \mathrm{~Hz}), 130.9(\mathrm{~d}, J=9.5 \mathrm{~Hz}), 130.5(\mathrm{~d}, J=8.6 \mathrm{~Hz}), 128.6(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 128.5(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 51.7$, $51.5,38.2(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 32.1(\mathrm{~d}, J=70.5 \mathrm{~Hz}), 31.2,29.9(\mathrm{~d}, J=9.5 \mathrm{~Hz}) .{ }^{31} \mathrm{P} \operatorname{NMR}\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ (ppm) 30.1. ## 3-(diphenylphosphoryl)-2-methylpropanenitrile (410).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.74 \sim 7.66(\mathrm{~m}, 4 \mathrm{H}), 7.50 \sim 7.38(\mathrm{~m}, 6 \mathrm{H}), 3.10 \sim 3.05(\mathrm{~m}$, $1 \mathrm{H}), 2.73 \sim 2.65(\mathrm{~m}, 1 \mathrm{H}), 2.46 \sim 2.37(\mathrm{~m}, 1 \mathrm{H}), 1.36(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ $132.9(\mathrm{~d}, J=100.0 \mathrm{~Hz}), 132.2(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 132.1(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 131.5(\mathrm{~d}, J=100.0 \mathrm{~Hz}), 130.8(\mathrm{~d}, \mathrm{~J}=9.5$ $\mathrm{Hz}), 130.3(\mathrm{~d}, J=9.6 \mathrm{~Hz}), 128.8(\mathrm{~d}, J=11.4 \mathrm{~Hz}), 121.8(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 34.1(\mathrm{~d}, J=68.6 \mathrm{~Hz}), 19.6(\mathrm{~d}, J=$ $1.9 \mathrm{~Hz}), 19.5(\mathrm{~d}, J=5.7 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 28.8$. HRMS (ESI) Calcd. for [M] ${ }^{+}$ $\mathrm{C}_{11} \mathrm{H}_{16} \mathrm{NOP}: 269.0969$, Found: 269.0947.

## 2-((diphenylphosphoryl)methyl)-2,4-dimethylpentanedinitrile (420).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.83 \sim 7.71(\mathrm{~m}, 4 \mathrm{H}), 7.51 \sim 7.44(\mathrm{~m}, 6 \mathrm{H}), 2.93 \sim 2.67(\mathrm{~m}$, $3 \mathrm{H}), 2.31 \sim 1.96(\mathrm{~m}, 2 \mathrm{H}), 1.57(\mathrm{~d}, J=2.4 \mathrm{~Hz}, 3 \mathrm{H}), 1.35(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $(\mathrm{ppm}) 133.3(\mathrm{~d}, J=101.0 \mathrm{~Hz}), 133.2,132.7(\mathrm{~d}, J=100.1 \mathrm{~Hz}), 132.2,130.8(\mathrm{~d}, J=8.6 \mathrm{~Hz}), 130.6(\mathrm{~d}, J=8.6$ $\mathrm{Hz}), 130.5(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 130.4(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 128.90(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 128.86(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 122.4(\mathrm{~d}, J$ $=11.5 \mathrm{~Hz}), 121.7(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 121.6(\mathrm{~d}, J=8.5 \mathrm{~Hz}), 43.3(\mathrm{~d}, J=4.7 \mathrm{~Hz}), 43.0(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 39.1(\mathrm{~d}, J$ $=67.6 \mathrm{~Hz}), 37.0(\mathrm{~d}, J=67.6 \mathrm{~Hz}), 34.8(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 34.3(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 26.8(\mathrm{~d}, J=4.8 \mathrm{~Hz}), 25.9(\mathrm{~d}, J=$ $5.8 \mathrm{~Hz}), 22.1(\mathrm{~d}, J=18.2 \mathrm{~Hz}), 19.5(\mathrm{~d}, J=17.2 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR ( $\left.162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 26.8,26.3 . \mathrm{HRMS}$ (ESI) Calcd. for [M] ${ }^{+} \mathrm{C}_{20} \mathrm{H}_{21} \mathrm{~N}_{2} \mathrm{OP}: 336.1391$, Found: 336.1416.

## Methyl 3-(diphenylphosphoryl)-2-methylpropanoate (41p).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.75 \sim 7.71(\mathrm{~m}, 4 \mathrm{H}), 7.50 \sim 7.42(\mathrm{~m}, 6 \mathrm{H}), 3.47(\mathrm{~s}, 3 \mathrm{H})$, $3.01 \sim 2.82(\mathrm{~m}, 2 \mathrm{H}), 2.33 \sim 2.25(\mathrm{~m}, 1 \mathrm{H}), 1.27(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 175.9$ $(\mathrm{d}, J=10.5 \mathrm{~Hz}), 134.0(\mathrm{~d}, J=99.1 \mathrm{~Hz}), 132.7(\mathrm{~d}, J=98.2 \mathrm{~Hz}), 131.8,131.0(\mathrm{~d}, J=9.6 \mathrm{~Hz}), 130.6(\mathrm{~d}, J=9.6$ $\mathrm{Hz}), 128.7(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 128.6(\mathrm{~d}, J=11.4), 51.9,33.69(\mathrm{~d}, J=92.5 \mathrm{~Hz}), 33.67(\mathrm{~d}, J=20.0 \mathrm{~Hz}), 19.2(\mathrm{~d}$, $J=7.7 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR $\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ 30.7. This compound is known. ${ }^{6 n}$

## Dimethyl (3-oxobutyl)phosphonate (41q).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.69(\mathrm{~d}, J=11.2 \mathrm{~Hz}, 6 \mathrm{H}), 2.72 \sim 2.65(\mathrm{~m}, 2 \mathrm{H}), 2.13(\mathrm{~s}$, $3 \mathrm{H}), 2.01 \sim 1.92(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 205.7(\mathrm{~d}, J=14.3 \mathrm{~Hz}), 52.4(\mathrm{~d}, J=6.7 \mathrm{~Hz})$, $36.1(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 29.6,18.9(\mathrm{~d}, J=14.4 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR $\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 35.0$. This compound is known. ${ }^{15}$

## Dimethyl (2-acetyl-5-oxohexyl)phosphonate (42q).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 3.66 \sim 3.62(\mathrm{~m}, 6 \mathrm{H}), 2.93 \sim 2.83(\mathrm{~m}, 1 \mathrm{H}), 2.45 \sim 2.29(\mathrm{~m}$, $2 \mathrm{H}), 2.25 \sim 2.14(\mathrm{~m}, 4 \mathrm{H}), 2.08(\mathrm{~d}, 3 \mathrm{H}), 1.94 \sim 1.85(\mathrm{~m}, 1 \mathrm{H}), 1.78 \sim 1.60(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ (ppm) $209.4(\mathrm{~d}, J=5.8 \mathrm{~Hz}), 207.2,52.5(\mathrm{~d}, J=7.6 \mathrm{~Hz}), 52.4(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 45.2(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 39.7,30.1$,
29.3, $26.1(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 25.9(\mathrm{~d}, J=132.5 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR $\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 33.0 . \mathrm{HRMS}$ (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{10} \mathrm{H}_{20} \mathrm{O}_{5} \mathrm{P}: 251.1048$, Found: 251.1030.

## 4-(diphenylphosphoryl)butan-2-one (41r).

White solid. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.69 \sim 7.64(\mathrm{~m}, 4 \mathrm{H}), 7.48 \sim 7.38(\mathrm{~m}, 6 \mathrm{H}), 2.73 \sim 2.67(\mathrm{~m}$, 2H), 2.51~2.44 (m, 2H), $2.05(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 206.2(\mathrm{~d}, J=13.4 \mathrm{~Hz}), 132.9$, $131.9(\mathrm{~d}, J=2.0 \mathrm{~Hz}), 130.8(\mathrm{~d}, J=9.6 \mathrm{~Hz}), 128.8(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 35.2(\mathrm{~d}, J=1.9 \mathrm{~Hz}), 29.8,23.7(\mathrm{~d}, J=73.4$ $\mathrm{Hz}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 33.1. This compound is known. ${ }^{16}$

## 3-((diphenylphosphoryl)methyl)heptane-2,6-dione (42r).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 7.69 \sim 7.58(\mathrm{~m}, 4 \mathrm{H}), 7.45,7.33(\mathrm{~m}, 6 \mathrm{H}), 2.97 \sim 2.79(\mathrm{~m}$, $2 \mathrm{H}), 2.43 \sim 2.24(\mathrm{~m}, 2 \mathrm{H}), 2.12 \sim 2.04(\mathrm{~m}, 1 \mathrm{H}), 1.99(\mathrm{~s}, 3 \mathrm{H}), 1.93 \sim 1.84(\mathrm{~m}, 4 \mathrm{H}), 1.73 \sim 1.64(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 209.4(\mathrm{~d}, J=4.8 \mathrm{~Hz}), 207.2,133.6(\mathrm{~d}, J=87.7 \mathrm{~Hz}), 132.4(\mathrm{~d}, J=86.7 \mathrm{~Hz}), 131.8$ $(\mathrm{d}, J=2.0 \mathrm{~Hz}), 130.8(\mathrm{~d}, J=9.5 \mathrm{~Hz}), 130.4(\mathrm{~d}, J=8.6 \mathrm{~Hz}), 128.7(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 128.5(\mathrm{~d}, J=12.3 \mathrm{~Hz}), 44.2$ $(\mathrm{d}, J=1.9 \mathrm{~Hz}), 39.6,30.3(\mathrm{~d}, J=71.4 \mathrm{~Hz}), 29.8,29.0,26.3(\mathrm{~d}, J=8.6 \mathrm{~Hz}) .{ }^{31} \mathrm{P} \operatorname{NMR}\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ (ppm) 31.5. HRMS (ESI) Calcd. for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{20} \mathrm{H}_{24} \mathrm{O}_{3} \mathrm{P}: 343.1463$, Found: 343.1440.

2-methylenepentanedinitrile (43).

Colorless oil. ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 6.02(\mathrm{~s}, 1 \mathrm{H}), 5.91(\mathrm{~s}, 1 \mathrm{H}), 2.64 \sim 2.56(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 133.4,119.0,117.5,117.1,30.4,16.0$. This compound is known. ${ }^{9}$

# Chapter 3. Radical Hydrophosphorylation of Alkynes with $\mathbf{R}_{\mathbf{2}} \mathbf{P}(\mathbf{O}) \mathbf{H}$ Generating Alkenylphosphine Oxides: Scope and Limitations 

## 3-1. Introduction

Organophosphorous compounds are of high importance in organic synthesis, biochemistry and material sciencies. ${ }^{1}$ The metal-catalyzed addition of a hydrogen phosphoryl compound $\mathrm{P}(\mathrm{O})-\mathrm{H}$ to an alkyne (hydrophosphorylation) is a powerful method for the preparation of an alkenylphosphoryl compound which is highly useful but difficult to prepare by the conventional method (Scheme 3-1). ${ }^{2}$ One of the remarkable features of this method is the nearly perfect controllable regio- and stereoselectivity of the addition products, i.e., both the $\alpha$-adduct and the $\beta$-adduct can be highly selectively generated, respectively, by employing the appropriate catalyst. ${ }^{2 b}$ However, despite its novelty, still there are few drawbacks associated with the metal-catalyzed hydrophoshorylations. One such drawback is the difficult removal of the metal-catalyst from the products because of the strong coordination of the $\mathrm{P}(\mathrm{O})$ products to the metals. ${ }^{3}$ As a result, the products prepared by the metal-catalyzed hydrophosphorylation, that inherently are colorless oil or white solid when pure, often are yellowish due to the contamination of the metals. This metal-contamination problem can hamper their application as starting materials for electronical materials and pharmaceuticals since "metal-free" clean chemicals are usually required.

Scheme 3-1 Metal-catalyzed addition of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to alkynes.

$[P(O)]-H=\mathrm{H}$-phosphonate, H-phosphinate, H-phosphine oxide

Radical-initiated additions (especially those of the photo-induced ones) of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds to alkynes
can avoid the above-mentioned metal-contamination problem, and hence may provide a solution to the metalcontaminating drawback of the metal-mediated hydrophosphorylations. From the literatures, it is expected that both a radical initiator (including oxygen) and light should possibly induce this kind of radical hydrophosphorylation. ${ }^{4}$ However, such studies are rather limited, and the scope and limitations of such a radical hydrophosphorylation are not clear. Thus, Russian chemists reported the radical addition of $\mathrm{R}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to alkynes initiated by dibenzoyl peroxide. ${ }^{4 g}$ However, the yield was low (ca. $24 \%$ yield). Recently, the hydrophosphorylation of terminal alkynes with $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ was conducted under photo-irradiation in the presence of 0.2~0.5 equiv. 2,2-dimethoxy-2-phenylacetophenone (DPAP) as an initiator. ${ }^{4 \mathrm{ab-b}}$ However, a large excess amount of $(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ (100 equivs) was required.

In conjunction with our studies on metal-mediated hydrophosphorylation, ${ }^{20,5}$ we feel it is necessary to have a proper assessment of the radical hydrophosphorylation reactions of alkynes with $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds. ${ }^{4 \mathrm{~b}}$ Herein we report our studies on the photo-irradiated and radical initiator-induced additions of H-phosphine oxides and related compounds to alkynes (eq 3-1). As described below, though, in general, far less efficient than that of the metal-mediated hydrophosphorylations, the combination of terminal aliphatic alkynes and H phosphine oxides can produce the $\beta$-adducts selectively in moderate to good yields. In particular, propargylic alcohols that could not be used in the palladium-mediated hydrophosphorylations ${ }^{5}$ are also applicable.

## 3-2. Results and Discussion

## 3-2-1. Light-induced addition of $P(O)$ - $H$ compounds to alkynes.

As shown in Table 3-1, a mixture of 1-octyne 44a and $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H} \mathbf{4 5 a}$ was sealed in a Pyrex glass tube ${ }^{6}$ under dry nitrogen atmosphere and irradiated using a high-pressure Hg lamp (Ushio, SX-U1501HQ) for 4h. In the absence of a solvent, an equimolar mixture of $\mathbf{4 4}$ a and $\mathbf{4 5 a}$ produced $49 \%$ yield of $\mathbf{4 6 a}$ as a $Z$ - and $E$-isomer mixture $(Z / E=67 / 33)($ run 1$)$. However, a side product 47 a by the double addition of $\mathbf{4 5 a}$ to $44 a$ was also generated in $15 \%$ yield based on 45a. ${ }^{7}$ By employing 2 equivalents of 45a, the yield of 46a increased to $61 \%$
(run 2), albeit 47a also increased to $29 \%$ yield. On the other hand, excess $\mathbf{4 4 a}$ suppressed the formation of $\mathbf{4 7 a}$ (runs 3 and 4), although too much of $\mathbf{4 4 a}$ lowered the yield of $\mathbf{4 6 a}$ (run 4). The reaction took place more cleanly in a solvent (runs 5-16) since the formation of 47a could be suppressed. Among the solvents investigated, $i$ PrOH was chosen as the optimal solvent in run 11 , a $70 \%$ yield of $\mathbf{4 6 a}(Z / E=73 / 27)$ could be obtained by using $i-\mathrm{PrOH}$ as the solvent.

Table 3-1. Addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to 1-octyne under photo-initiated conditions. ${ }^{a}$

[^0]As shown in Table 3-2, in order to demonstrate the generality of this reaction, a variety of alkynes was used to carry out the photo-irradiated additions. Similar to 1-octyne, terminal aliphatic alkynes with an ester group (run 3) or a hydroxyl group (run 4) could react to give the corresponding adducts in good yields. Alkynes with chloro (run 2) group, however, gave low yields of the products. The bulky tert-butylacetylene (run 5) also produced the corresponding adducts, albeit with the $E$-isomer as the major product due to steric reasons (vide infra). A conjugated alkyne (run 6), phenylacetylene (run 7) and internal alkyne (run 16), however, hardly produced the adducts under current conditions, and most of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ remained unreacted. ${ }^{8}$ Remarkably, however, the very bulky silylacetylenes (runs 8 and 9) and propargyl alcohols (runs 10-15) all gave the adducts in good yields. An interesting phenomenon is that, being different from tert-butylacetylene (run 5), both the bulky silylacetylenes and propargyl alcohols, all give the $Z$-adduct as the major stereoisomer, indicating that the $\mathrm{R}_{3} \mathrm{Si}$ and OH groups significantly contribute to the reactions (vide infra). The efficient reactions with these cheap propargyl alcohols are practically important. Moreover, they are also novel because similar additions by the palladium-catalyzed hydrophosphorylation hardly took place. ${ }^{5}$ As expected, under similar conditions, the reaction conducted at 1 mmol scale gave similar results. For example, a mixture of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}(242.6 \mathrm{mg}, 1.2$ mmol) and 2-methyl-3-butyn-2-ol $(84.1 \mathrm{mg}, 1.0 \mathrm{mmol})$ in $i-\operatorname{PrOH}(1.0 \mathrm{~mL})$ under photoirradiation for 4 h gave a $76 \%$ yield $(Z / E=77 / 23)$ of $\mathbf{4 6 m}$ after purification using short column chromatography on silica gel (eluent $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}=100 / 1\right)$.

${ }^{a}$ Reaction conditions: a $i$ - PrOH solution of an alkyne and $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ in a Pyrex-tube was irradiated using a high-pressure Hg lamp (Ushio, SX-U1501HQ). The products were isolated using a recycling preparative HPLC (JAI) equipped with a 1 H and 2 H GPC columns using $\mathrm{CHCl}_{3}$. ${ }^{b}$ Isolated yield. ${ }^{c}$ The $Z / E$ ratio was determined for the crude mixture by GC or ${ }^{31} \mathrm{P}$ NMR. ${ }^{d} \mathrm{Ca} .25 \%$ of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{P}(\mathrm{O}) \mathrm{Ph}_{2}$ was detected, which was generated by the desilylation of $\mathbf{4 6 h}$ followed by the addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$.

## 3-2-2 Mechanistic study.

As shown in eq 3-2, as expected, the addition reaction did not proceed in the presence of the radical scavenger 2,2,6,6-tetramethyl-1-piperidin-1-oxyl (TEMPO). ${ }^{4 h}$ A possible mechanism for this photoinduced hydrophosphorylation is shown in Scheme 3-2. The phosphoryl radical generated under light ${ }^{4}$ adds to alkynes to generate alkenyl radicals which exists in trans I and cis II forms with the former being more stable but less reactive and the latter being more reactive but less stable. ${ }^{9}$ Subsequent reactions of I and II with $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ give the corresponding alkenylphosphine oxides. The $Z / E$ ratio of the adducts reflects the result of reactions of I and II. Since II is more reactive, usually $Z$-adduct was generated as the major product. However, if R is too bulky ( $t$-Bu, for example), the vinyl radical might predominantly exist in the trans form $\mathbf{I}$, which consequently generates the $E$-adduct as the major isomer. As shown in Scheme 3-2, it was expected that a silyl group and OH group could interact with the phosphoryl group to stabilize the cis-radical II. Therefore, different from tert-butylacetylene, $Z$-adducts were generated from these bulky alkynes.

Scheme 3-2 A possible mechanism for the photo-induced addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to alkynes.

Under similar conditions, the reactions of other $[P]-\mathrm{H}$ compounds were investigated (Table 3-3). The bulky $\mathrm{Ph}(t-\mathrm{Bu}) \mathrm{P}(\mathrm{O}) \mathrm{H}$ (run 1) also produced the corresponding adducts in $45 \%$ yield. Aliphatic phosphine oxides (runs 2 and 3) reacted similarly. $\mathrm{Ph}(\mathrm{EtO}) \mathrm{P}(\mathrm{O}) \mathrm{H}$ could also produce the corresponding adducts. However, additions with $(\mathrm{EtO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ hardly proceeded. Therefore, the reactivity of $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds roughly follow a decreasing order of H-phosphine oxide $>$ H-phosphinate $>$ H-phosphonate. Finally, diphenylphosphine $\mathrm{Ph}_{2} \mathrm{PH}$ could also be used as the substrate to produce the corresponding alkenylphosphine in good yields (run $6)$.

The $Z$ - and $E$-isomer configuration of the synthesized compounds was assigned on the basis of ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra. The ethenyl proton on one carbon of alkene bond is always more strongly coupled to another ethenyl proton on another carbon in tians compound than in cis compound: $\left[{ }^{3} J_{\mathrm{HH}}\right]_{\text {tans }}>\left[{ }^{3} J_{\mathrm{HH}}\right]_{\text {cis }}$. This observation, in addition to the coupling constants of ${ }^{3} J_{\mathrm{PH}}$, allows the safe assignments of $Z$ and $E$ isomers.

Table 3-3. Light-induced addition of $\mathrm{P}(\mathrm{O}) \mathrm{H}$ compounds to 1-octyne. ${ }^{a}$

${ }^{a}$ Reaction was similarly carried out and the products were isolated as described in Table 3-2. ${ }^{b}$ Isolated yield. ${ }^{c}$ The $Z / E$ ratio was determined for the crude mixture by GC or ${ }^{31} \mathrm{P}$ NMR. ${ }^{d}$ Calculated based on ${ }^{31} \mathrm{P}$ NMR after 8 h irradiation with a xenon lamp. Isolated as its corresponding $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O})$ compounds by oxidation with $\mathrm{H}_{2} \mathrm{O}_{2}$.

Finally, since photo-initiated addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to terminal olefins also took place, ${ }^{4 \mathrm{~h}}$ to compare the
reactivity of a double bond with a triple bond, we carried out a competed reaction of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}(0.1 \mathrm{mmol})$ between 1-octene ( 0.1 mmol ) and 1-octyne ( 0.1 mmol ) (eq 3-3). As determined by NMR, the ratio of the products from 1-octene $\mathbf{4 8} v s$ that from 1-octyne 46a was $63 / 37$, indicating that an olefin is more reactive (ca. two times faster) than an alkyne.

## 3-2-3. Radical-initiator-induced addition of $\mathrm{P}(\mathrm{O}) \mathrm{H}$ compounds to alkynes.

As shown in Table 3-4, $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ can add to 1 -octyne in the presence of a radical initiator. Thus, a mixture of the two reagents in benzene on heating at $70^{\circ} \mathrm{C}$ in the presence of $10 \mathrm{~mol} \% \mathrm{AIBN}^{10}$ produced a mixture of the mono-addition product 46a and the double addition product 47a in $43 \%$ and $29 \%$ yields, respectively (run 1). The reaction also took place in THF, although the yield of the double addition product $\mathbf{4 7}$ a slightly increased (run 2). As shown in the Table 3-4, the formation 47a could be negligible by carrying out the reaction in a more diluted solution (runs 3 and 4) or at lower temperatures (runs 5 and 6). Interestingly, the $Z / E$ selectivity of 46a could be over $8 / 2$ when carrying out the reaction in EtOH , although the yields were low (runs 7, 8). By conducting the reaction using a radical initiator that decomposes at a low temperature $\mathrm{V}-70$ [2,2'-azobis(4-methoxy-2,4-dimethylvaleronitrile)], ${ }^{10}$ moderate yields of 46 a could be generated selectively (runs 9-11). Moreover, with $20 \%$ of an initiator V-601 [dimethyl 2, $2^{\prime}$-azobis(isobutyrate)] ${ }^{10}$, moderate yields of 3a with high $Z / E$ selectivities could also be generated (runs 13-16). Since air can initiate the radical addition of $\mathrm{P}(\mathrm{O})$ H compounds, ${ }^{4 d}$ as expected, $58 \%$ yield of 46 a could also be generated by conducting the reaction under air.

${ }^{a}$ Reactions conditions: a mixture of $\mathbf{4 4 a}(0.2 \mathrm{mmol}), \mathbf{4 5 a}(0.1 \mathrm{mmol})$, a radical initiator and a solvent $(0.2$ mL ) was sealed in a Pyrex-tube ( 1 mL ) under nitrogen atmosphere and heated overnight. ${ }^{b}$ The yield of 46 a based on 45a and the $Z / E$ ratio were determined from crude mixture by GC. ${ }^{c}$ The yield of 47a based on 45a was estimated from ${ }^{31} \mathrm{P}$ NMR. ${ }^{d} 10 \mathrm{~mol} \%$ AIBN. ${ }^{e} 0.3 \mathrm{~mL} .{ }^{f} 0.5 \mathrm{~mL} .{ }^{g} 10 \mathrm{~mol} \% \mathrm{~V}-70 .{ }^{h} \mathbf{4 4 a}(0.1 \mathrm{mmol}) .{ }^{i} 20 \mathrm{~mol} \%$

V-601. ${ }^{j} 40 \mathrm{~mol} \% \mathrm{~V}-601 .{ }^{k}$ The Pyrex tube was sealed with air.

However, unfortunately, similar to the photo-induced radical addition described above, this radical-initiatorinduced addition does not apply to phenylacetylenes and other conjugate alkynes related. ${ }^{8,11}$ Furthermore, hydrogen phosphonates $(\mathrm{RO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ were also hardly applicable to this reaction.

## 3-3. Conclusion

In conclusion, the radical hydrophosphorylation of alkynes with $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compounds by photo-irradiation or radical-initiators have been studied. It appears that hydrogen phosphonates $(R O)_{2} P(O) H$ and conjugated alkynes are not applicable to this reaction. However, with the combination of H-phosphine oxides $\mathrm{R}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ and aliphatic terminal alkynes, moderate yields of the anti-Marcovnikov alkenylphosphine oxides could be generated. In particular, propargyl alcohols, which are not applicable to the palladium-catalyzed hydrophosphorylations, ${ }^{5}$ can give the corresponding adducts in good yields. Therefore, this metal-free clean radical hydrophosphorylation can serve, to some extent, as a good complimentary to the metal-mediated hydrophosphorylation of alkynes.

## 3-4. Experimental section

General information: All materials were purchased and used without further purification. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a JEOL JNM-ECS400 ( 400 MHz ) FT NMR system in $\mathrm{CDCl}_{3}$ with $\mathrm{Me}_{4} \mathrm{Si}$ as an internal standard. ${ }^{13} \mathrm{C}$ NMR spectra were taken on a JEOL JNM-ECS400 $(100 \mathrm{MHz})$ FT NMR system in $\mathrm{CDCl}_{3 .}{ }^{31} \mathrm{P}$ NMR spectra were taken on a JEOL JNM-ECX400 ( 162 MHz ) FT NMR system in $\mathrm{CDCl}_{3}$ with $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ solution as an external standard. Isolation using a preparative HPLC (recycle GPC) was performed on a Japan Analytical Industry LC-908 equipped with JAIGEL-1H and JAIGEL-2H columns.

General procedures for Table 1: a mixture of 44a and 45a in a solvent ( 0.3 ml ) (or neat, run 1-4, Table 1) was sealed in a Pyrex tube under dry nitrogen (or dry air, run 16) and irradiated using a high-pressure Hg lamp (Ushio, SX-U501HQ) for 4 h . After then, the reaction mixture was monitored by GC and ${ }^{31} \mathrm{P}-\mathrm{NMR}$.

General procedures for Table 2 and 3: to a solution of $44(0.1 \mathrm{mmol})$ and $\mathbf{4 5}(0.12 \mathrm{mmol})$ in $i-\mathrm{PrOH}(0.3$ mL ) was sealed in a Pyrex-tube under dry nitrogen and irradiated using a high-pressure Hg lamp (Ushio, SX$\mathrm{U} 1501 \mathrm{HQ})$ for 4 h . After then, the reaction mixture was concentrated under vacuum. The crude product was purified by a recycling preparative HPLC (JAI) equipped with a 1 H and 2 H GPC columns using $\mathrm{CHCl}_{3}$ as eluent to obtain $Z$ - and $E$-isomer, respectively, or a mixture of $Z$ and $E$-isomer.

General Procedures for Table 4: to a solution of $\mathbf{4 4 a}(0.2 \mathrm{mmol}), \mathbf{4 5 a}(0.1 \mathrm{mmol})$ and a radical initiator in solvent ( 0.2 mL ) was sealed in a Pyrex-tube under nitrogen atmosphere (or dry air, run 17 Table 4). The reaction mixture was heated to setting temperature and stirred for overnight. After then, the reaction mixture was monitored by GC and ${ }^{31} \mathrm{P}$ NMR.
(Z)-oct-1-en-1-yldiphenylphosphine oxide [46a (Z)]. ${ }^{12}$

Gen. Chem. USSR (Engl. Transl.) 1985, 55, 2263-2269. For photo-induced addition of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ to terminal alkenes, see (h) Kawaguchi, S.-I.; Nomoto, A.; Sonoda, M.; Ogawa, A. Tetrahedron Lett. 2009, 50, 624-626.
[5] Chen, T.; Zhao, C.; Han, L.-B. J. Am. Chem. Soc. 2018, 140, 3139-3155.
[6] A xenon lamp gave similar results, because a Pyrex tube was used; $h v>300 \mathrm{~nm}$ was the actual light source for the reaction. In a Quartz tube $(h v>200 \mathrm{~nm})$, the reaction also took place, despite a $Z / E$ ratio of $38 / 62$ was obtained under the conditions of run 1. A separate reaction confirmed that while Z-46a does not isomerize to $E-46$ a in a Pyrex tube, this isomerization of $Z-46$ a to $E-46$ a took place rapidly in a Quartz tube.
[7] The reaction should not be conducted at a more elevated temperature because the formation of $\mathbf{4 7 a}$ increased (see ref 4d).
[8] Phenylacetylene was slowly consumed ( $6 \%$ consumed after 4 h , and $12 \%$ consumed after 16 h ), and the oligomerization products of phenylacetylene could be detected. However, $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ remained unchanged even after 16 h .
[9] For a discussion, see Han, L.-B.; Ishihara, K.-I.; Kambe, N.; Ogawa, A.; Ryu, I.; Sonoda, N. J. Am. Chem. Soc. 1992, 114, 7591-7592.
[10] Half-life $(10 \mathrm{~h})$ temperatures of these radical initiators: AIBN, $65^{\circ} \mathrm{C} ; \mathrm{V}-601,66^{\circ} \mathrm{C} ; \mathrm{V}-70,30^{\circ} \mathrm{C}$.
[11] Only trace amount of the addition products ( $<5 \%$ estimated by ${ }^{31} \mathrm{P}$ NMR) could be detected from the reaction of phenylacetylene $(0.2 \mathrm{mmol})$ with $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}(0.1 \mathrm{mmol})$ in THF $(0.5 \mathrm{~mL})$ heated at $70{ }^{\circ} \mathrm{C}$ in the presence of $10 \mathrm{~mol} \%$ AIBN. While some oligomerization of phenylacetylene was observed, most of $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{H}$ remained unchanged.

# Chapter 4. Oxidative Dephosphorylation of Benzylic Phosphonates with Dioxygen Generating Symmetrical trans-Stilbenes 

## 4-1. Introduction

Stilbenes are widely used for manufacturing industrial dyes, dye lasers, phosphors, optical brighteners, scintillators, and other materials. ${ }^{1}$ Their related polymer poly(pphenylenevinylene)s (PPVs) are an important class of conjugated polymer materials that have wide applications in light-emitting diodes and photovoltaic devices. ${ }^{1 \mathrm{~b}}$ As such, the development of a simple method for the preparation of stilbenes from readily available starting materials is of high interest. Currently, these compounds can be prepared by a few methods, ${ }^{2}$ such as Wittig reaction, ${ }^{3}$ Horner-Wadsworth- Emmons reaction, ${ }^{4}$ Heck reaction, ${ }^{5}$ and Julia olefination ${ }^{6}$ (Scheme 41). However, those methods for the synthesis of symmetrical stilbenes require the condensation of two different fragments that have to be separately synthesized. The selective semihydrogenation of alkynes is also an important way to produce stilbenes (eq 4-5 in Scheme 1). ${ }^{7}$ However, problems can arise by over-reduction of the triple bonds to the corresponding alkanes. Moreover, with substrates bearing reducible groups, an intractable mixture of products could be obtained. The McMurry reductive coupling of two carbonyl compounds is another way to generate stilbenes (eq 4-6 in Scheme 1). ${ }^{8}$

Scheme 4-1. Representative Methods for the Preparation of Olefins.

## 4-2. Results and Discussion

We noticed that Horner has briefly disclosed the generation of stilbene by treating $\mathrm{PhCH}_{2} \mathrm{P}(\mathrm{O}) \mathrm{Ph}_{2}$ with $t$ BuOK under dioxygen. ${ }^{9}$ We realized that this reaction could become a very convenient way for the synthesis of symmetrical stilbenes since the starting materials are commercially available (or easily prepared), the reaction was easily conducted, and the products are readily isolated by simply washing away the phosphonate side products with water. However, a detailed study of this reaction on its scope and limitations is not available. Herein, we report our reinvestigation on the oxidative dephosphorylation of benzylic phosphonates selectively forming trans-stilbenes (eq 4-7).

The commercially available diethyl benzylphosphonate (49a) was mixed with a slightly excess amount of sodium tert-butoxide ( 1.5 equiv.) under a dioxygen atmosphere in anhydrous DMF at room temperature (entry 1, Table 4-1) to afford trans-stilbene in an almost quantitative yield. Noteworthy is that the reaction took place highly stereoselectively since no cis-stilbene could be detected by FID-GC from the mixture. The yields of stilbene were reduced when less sodium tert-butoxide was used (entries 2 and 3). The reaction also proceeded efficiently in DMSO but proceeded poorly in EtOAc, THF, and benzene (entries 4-7). As to the base, $\mathrm{NaHCO}_{3}$, $\mathrm{NaOAc}, \mathrm{Na}_{2} \mathrm{CO}_{3}$, and $\mathrm{K}_{2} \mathrm{CO}_{3}$ were not effective in this reaction. $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ could also promote this reaction,
though the yields of stilbene were low (entries $8-14$ ). KOH gave a $79 \%$ yield of stilbene at $100{ }^{\circ} \mathrm{C}$ (entries 15-17), and EtONa was as efficient as $t$ - BuONa to give $98 \%$ yield of the product (entry 18 ).

Table 4-1 Optimization of the Reaction Conditions. ${ }^{a}$

| Entry | Base | Solvent | temp. $\left({ }^{\circ} \mathrm{C}\right)$ | yield ${ }^{\text {b }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $t$-BuONa | DMF | 25 | 98 \% |
| $2^{c}$ | $t$-BuONa | DMF | 25 | 30 \% |
| $3{ }^{\text {d }}$ | $t$-BuONa | DMF | 25 | 71 \% |
| 4 | $t$-BuONa | DMSO | 25 | 97 \% |
| 5 | $t$-BuONa | EtOAc | 25 | n.d. |
| 6 | $t$-BuONa | THF | 25 | $3 \%$ |
| 7 | $t$-BuONa | benzene | 25 | n.d. |
| 8 | $\mathrm{NaHCO}_{3}$ | DMF | 100 | n.d. |
| 9 | NaOAc | DMF | 100 | n.d. |
| 10 | $\mathrm{Na}_{2} \mathrm{CO}_{3}$ | DMF | 100 | n.d. |
| 11 | $\mathrm{K}_{2} \mathrm{CO}_{3}$ | DMF | 100 | n.d. |
| 12 | $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ | DMF | 25 | $4 \%$ |
| 13 | $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ | DMF | 60 | 14 \% |
| 14 | $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ | DMF | 100 | 29 \% |
| 15 | KOH | DMF | 25 | 38 \% |
| 16 | KOH | DMF | 60 | 56 \% |
| 17 | KOH | DMF | 100 | 79 \% |
| 18 | EtONa | DMF | 25 | 98 \% |

${ }^{a}$ Reaction conditions: To a solution of diethyl benzylphosphonate 49 ( 1.0 mmol ) in solvent $(1.0 \mathrm{~mL})$ was added base ( 1.5 mmol ) under $\mathrm{N}_{2}$. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 5 mins . After then, the reaction mixture was degassed under vacuum and purged with $\mathrm{O}_{2}$ several times, and then stirred under $\mathrm{O}_{2}$ balloon at the indicated temperature for $8 \mathrm{~h} .{ }^{b} \mathrm{GC}$ yield. ${ }^{c} t$ - $\mathrm{BuONa}(0.5 \mathrm{mmol}) .{ }^{d} t$-BuONa $(1.0 \mathrm{mmol})$.

Under the optimized reaction conditions, dimethyl benzylphosphonate and diisopropyl benzylphosphonate also produced the corresponding stilbene in $87 \%$ and $92 \%$ yields, respectively. In addition, benzyldiphenylphosphine oxide also produced $95 \%$ isolated yield of stilbene under the similar conditions (eq 4-8).

Next, we explored the generality of this reaction by examining benzylic phosphonate bearing a variety of substituents. As demonstrated in Table 4-2, a remarkable feature of this reaction is its good compatibility with a wide range of functional groups. Halogens substituents such as $\mathrm{F}, \mathrm{Cl}, \mathrm{Br}$, and I were all well compatible and gave the desired products in high yields (50e-h). 4-Methylbenzyl diethylphosphonate (49i) also reacted smoothly to give the desired product $\mathbf{2 i}$ in $88 \%$ yield. A vinyl group was also tolerable to give the corresponding stilbene $\mathbf{5 0 j}$ in $85 \%$. Benzyl phosphonate bearing electron-withdrawing groups could be used as substrates to produce the corresponding stilbenes in high to excellent yields (50k-0). For example, trans-4,4'Bis(trifluormethyl)stilbene (50k) was obtained in $84 \%$ yield under these optimized reaction conditions. With a more labile ester substituent and a nitro substituent, the reactions were conducted using cesium carbonate as the base to produce the corresponding stilbenes in $86 \%$ and $95 \%$ yields, respectively ( $\mathbf{2 l}$ and $\mathbf{2 m}$ ). Substrate
with CN and $\mathrm{MeSO}_{2}$ groups also produced the desired products in high yields while keeping the functional groups intact (50n and 500).

${ }^{a}$ Reaction conditions: Phosphonate $(0.5 \mathrm{mmol}), t$-BuONa $(0.75 \mathrm{mmol})$, DMF $(1.0 \mathrm{~mL}), 25{ }^{\circ} \mathrm{C} .8 \mathrm{~h} .{ }^{b}$ isolated yield. ${ }^{c} \mathrm{Cs}_{2} \mathrm{CO}_{3}(0.75 \mathrm{mmol}), 100^{\circ} \mathrm{C}, 16 \mathrm{~h} .{ }^{d} \mathrm{Cs}_{2} \mathrm{CO}_{3}(0.75 \mathrm{mmol}), 80^{\circ} \mathrm{C}, 16 \mathrm{~h}$.

The position of the bromo atom did not obviously affect the reaction yields since both the ortho- or metabromo benzyl phosphonates all gave the desired product in excellent yields ( $\mathbf{5 0 p}$ and $\mathbf{5 0 q}$ ). Notably, sterically hindered substrates such as diethyl (naphthalen-2-ylmethyl)phosphonate (49r) and diethyl ([1,1'-biphenyl]-4ylmethyl)phosphonate (49s) also successfully afforded the products in $94 \%$ and $96 \%$ yields, respectively (50r and 50s). In all the cases, the reaction was highly selective for the formation of the trans-stilbene derivatives, and even a tiny amount of cis-stilbene derivatives were not detected from all the examples as confirmed by GC and ${ }^{1} \mathrm{H}$ NMR spectroscopy.

A possible reaction mechanism for this oxidative dephosphorylation coupling reactions of diethyl benzylphosphonate (49a) is illustrated in Scheme 4-2. First, the base sodium tert-butoxide abstracts the benzylic proton generating an anion I. Anion I then reacts with $\mathrm{O}_{2}$ to yield II. This intermediate II may react via an intermediate such as III to liberate 49aa and benzaldehyde 49ab. A subsequent Horner-Emmons reaction of 49ab with I produces the product $\mathbf{5 0 a}$.

Scheme 4-2. Proposed Mechanism.

The above mechanism was supported by the following observations. First, the formation of the carbonyl compounds was clearly observed. Thus, by using $\alpha$-substituted benzyl phosphonates $49 \mathrm{t}-49 \mathbf{w}$, the corresponding ketones were obtained in high yields (51a-51d, Table 4-3). ${ }^{10}$

Table 4-3. Ketone Formation from $\alpha$-Substituted Benzylic Phosphonates. ${ }^{a}$

Second, the formation of II could be confirmed undoubtedly. For example, 32\% yield of 52a was observed from the reaction of a carbanion $49 \times$ a with $\mathrm{O}_{2}$ at $-78{ }^{\circ} \mathrm{C}$ (Scheme 4-3)..$^{11}$

Scheme 4-3. Control Experiments

## 4-3. Conclusion

In summary, we reported a powerful method for the preparation of symmetrical trans-stilbenes through the oxidative dephosphorylation of related benzylphosphonates. In addition to its simplicity, high yield and selectivity, a remarkable feature of this method is that it is compatible with a wide range of labile functionalities which enables to highly functionalized symmetrical trans-stilbenes.

## 4-4. Experimental Section

General comments: All materials were obtained from commercial supplies and they were used without further purification. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on JEOL JNM-ECS400 (400 MHz) FT NMR in $\mathrm{CDCl}_{3}$ with $\mathrm{Me}_{4} \mathrm{Si}$ as an internal standard. ${ }^{13} \mathrm{C}$ NMR spectra were taken on JEOL JNM-ECS400 ( 100 MHz ) FT NMR system in $\mathrm{CDCl}_{3} .{ }^{31} \mathrm{P}$ NMR spectra were taken on JEOL JNM-ECX400 ( 162 MHz ) FT NMR system in $\mathrm{CDCl}_{3}$ with $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ solution as an external standard. HPLC (recycle GPC) method for isolation was performed on JAPAN ANALYTICAL INDUSTRY LC-908 with JAIGEL-1H (polystyrene-based column). Melting points were obtained on OptiMelt Automated Melting Point System (Standford Research Systems). GC-MS spectra were taken on SHIMADZU GC-2010 and GCMS-QP2010 Plus. Elemental analysis was accomplished on Thermo Scientific Flash 2000 Organic Elemental Analyzer; data were processed with Eager Xperience.

Synthesis of Precursors 49b, 49c, 49d, 49j, 49k, 49l, 49o-49s and 49x. General procedure A: To a solution of diethyl phosphonate $(1.0 \mathrm{~g}, 7.24 \mathrm{mmol})$ in DMF $(5.0 \mathrm{~mL})$ was added sodium hydride $(228 \mathrm{mg}, 9.04$
mmol ) under $\mathrm{N}_{2}$ and ice-water bath. After stirred at $0^{\circ} \mathrm{C}$ for 30 mins, 1-bromo-3-(bromomethyl)benzene ( 1.810 $\mathrm{g}, 7.24 \mathrm{mmol}$ ) was added. After stirred at $0^{\circ} \mathrm{C}$ for another 30 mins , the reaction mixture was warmed up to room temperature and stirred for 8 h . The reaction mixture was monitored by GC. The reaction mixture was quenched with aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with $\mathrm{EtOAc}(3 \times 5 \mathrm{~mL})$. The combined organic layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under vacuum. The crude product was purified by silica gel on column chromatography to obtain the analytically pure samples

Synthesis of Precursors 49t-49w. General procedure B: A mixture of (bromomethylene)dibenzene $(1.235 \mathrm{~g}, 5.0 \mathrm{mmol})$ and triethyl phosphite $(913 \mathrm{mg}, 5.5 \mathrm{mmol})$ was heated at $150^{\circ} \mathrm{C}$ for 3 h under a still head until ethyl bromide ceased to distill. The residual viscous yellow oil was purified by silica gel on column chromatography (diethyl ether elution). Evaporation of the solvent under reduced pressure gave a white crystalline product in $83 \%$ yield.

Synthesis of product 50a, 50e-50s and 51a-51d. General procedure C: To a solution of phosphonate (1 $\mathrm{mmol})$ in solvent $(1.0 \mathrm{~mL})$ was added base $(1.5 \mathrm{mmol})$ under $\mathrm{N}_{2}$. The reaction mixture was stirred at room temperature for 5 mins. After then, the reaction mixture was degassed under vacuum and purged with $\mathrm{O}_{2}$ several times, and then stirred under $\mathrm{O}_{2}$ balloon at room temperature for 8 h . The reaction mixture was quenched with water $(1 \mathrm{~mL})$ and extracted with $\mathrm{EtOAc}(3 \times 2 \mathrm{~mL})$. The combined organic layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ filtered and concentrated under vacuum. The crude product was purified by GPC to get the analytically pure samples.

## Dimethyl benzylphosphonate (49b):

This compound was prepared according the general procedure A from dimethyl phosphite ( $1.0 \mathrm{~g}, 9.09$ mmol ), sodium hydride ( $436 \mathrm{mg}, 10.91 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) and (bromomethyl)benzene $(1.554 \mathrm{~g}, 9.09 \mathrm{mmol})$ : yield $1.672 \mathrm{~g}(92 \%)$; colorless liquid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.27 \sim 7.15$
(m, 5H), $3.60(\mathrm{~d}, J=11.2 \mathrm{~Hz}, 6 \mathrm{H}), 3.12(\mathrm{~d}, J=22.0 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 131.0(\mathrm{~d}$, $J=9.5 \mathrm{~Hz}), 129.5(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 128.4(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 126.8(\mathrm{~d}, J=3.8 \mathrm{~Hz}), 52.7(\mathrm{~d}, J=6.6 \mathrm{~Hz}), 32.6(\mathrm{~d}, J$ $=138.2 \mathrm{~Hz}) \cdot{ }^{31} \mathrm{P}-\mathrm{NMR}\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 29.62 . \mathrm{GC}-\mathrm{MS}(\mathrm{EI}, 70 \mathrm{eV}) \mathrm{m} / \mathrm{z}=201\left([\mathrm{M}+\mathrm{H}]^{+}, 3\right), \quad 200$ $\left(\mathrm{M}^{+}, 29\right), 109(16), 105(25), 104(41), 91(100), 79(14), 65(22)$. This compound is known. ${ }^{12}$

## Diisopropyl benzylphosphonate (49c):

This compound was prepared according the general procedure A from diisopropyl phosphite (1.0 g, 6.02 mmol ), sodium hydride ( $289 \mathrm{mg}, 7.22 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) and (bromomethyl)benzene ( 1.029 $\mathrm{g}, 6.02 \mathrm{mmol})$ : yield $1.465 \mathrm{~g}(95 \%)$; colorless liquid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.25 \sim 7.12(\mathrm{~m}, 5 \mathrm{H})$, $4.58 \sim 4.46(\mathrm{~m}, 2 \mathrm{H}), 3.03(\mathrm{~d}, J=21.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.20(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 6 \mathrm{H}), 1.09(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}$ $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 131.7(\mathrm{~d}, J=8.6 \mathrm{~Hz}), 129.6(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 128.1(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 126.43(\mathrm{~d}, J=$ $2.8 \mathrm{~Hz}), 70.2(\mathrm{~d}, J=6.7 \mathrm{~Hz}), 34.6(\mathrm{~d}, J=139.2 \mathrm{~Hz}), 23.8(\mathrm{~d}, J=3.9 \mathrm{~Hz}), 23.5(\mathrm{~d}, J=4.8 \mathrm{~Hz}) .{ }^{31} \mathrm{P}-\mathrm{NMR}(162$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ 25.28. GC-MS (EI, 70 eV$) m / z=256\left(\mathrm{M}^{+}, 11\right), 214(25), 199(28), 173$ (34), $172(34)$, 123 (33), 119 (31), 92 (43), 91 (100), $65(26), 59$ (13). This compound is known. ${ }^{12}$

## Benzyldiphenylphosphine oxide (49d):

This compound was prepared according the general procedure A from diphenylphosphine oxide ( 1.0 g , 4.95 mmol ), sodium hydride ( $238 \mathrm{mg}, 5.94 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) and (bromomethyl)benzene ( $847 \mathrm{mg}, 4.95 \mathrm{mmol}$ ): yield $1.389 \mathrm{~g}(96 \%)$; white solid; mp: $190-192{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}, \mathrm{DMSO}): ~ \delta$ (ppm) 7.81~7.76 (m, 4H), 7.50~7.45 (m, 6H), 7.14~7.11 (m, 5H), 3.87 (d, $J=14.0 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}(100$ MHz, DMSO): $\delta(\mathrm{ppm}) 133.5(\mathrm{~d}, J=96.3 \mathrm{~Hz}), 132.3(\mathrm{~d}, J=7.6 \mathrm{~Hz}), 131.7,130.8(\mathrm{~d}, J=9.6 \mathrm{~Hz}), 130.2(\mathrm{~d}, J$
$=4.8 \mathrm{~Hz}), 128.6(\mathrm{~d}, J=11.5 \mathrm{~Hz}), 128.0,126.4,36.0(\mathrm{~d}, J=64.8 \mathrm{~Hz}) .{ }^{31} \mathrm{P}-\mathrm{NMR}(162 \mathrm{MHz}, \mathrm{DMSO}): \delta(\mathrm{ppm})$

## (E)-4,4'-(ethene-1,2-diyl)dibenzonitrile (50n):

This compound was prepared according the general procedure C from $\mathbf{4 9 n}(253 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium
tert-butoxide (144 mg, 1.5 mmol$):$ yield $218 \mathrm{mg}(95 \%)$; white solid; mp: 286-288 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.67(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 4 \mathrm{H}), 7.61(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 4 \mathrm{H}), 7.19(\mathrm{~s}, 2 \mathrm{H}) . \mathrm{GC}-\mathrm{MS}(\mathrm{EI}, 70 \mathrm{eV}) \mathrm{m} / \mathrm{z}=$ $231\left([\mathrm{M}+\mathrm{H}]^{+}, 17\right), 230\left(\mathrm{M}^{+}, 100\right), 229(63), 228(11), 215(21), 203(15), 202(17), 201(13), 190(35), 101$ (10), 88 (17), 75 (11). This compound is known. ${ }^{26}$

## (E)-1,2-bis(4-(methylsulfonyl)phenyl)ethene (500):

This compound was prepared according the general procedure $C$ from $490(306 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide (144 mg, 1.5 mmol ): yield $316 \mathrm{mg}(94 \%)$; white solid; mp: 311-314 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.92 \sim 7.86(\mathrm{~m}, 8 \mathrm{H}), 7.55(\mathrm{~s}, 2 \mathrm{H}), 3.20(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 141.8$, 139.9, 130.4, 127.63, 127.58, 43.6. GC-MS (EI, 70 eV$) m / z=337\left([\mathrm{M}+\mathrm{H}]^{+}, 20\right), 336\left(\mathrm{M}^{+}, 100\right), 321(2), 257$ (10), 242 (2), 207 (34), 194 (21), 178 (62), 177 (23), 176 (27), 166 (60), 165 (45), 152 (22), 151 (14). This compound is known. ${ }^{27}$

## (E)-1,2-bis(3-bromophenyl)ethene (50p):

This compound was prepared according the general procedure $C$ from $49 \mathrm{p}(307 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide (144 mg, 1.5 mmol$)$ : yield $304 \mathrm{mg}(90 \%)$; white solid; mp: 101-102 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.65\left(\mathrm{dd}, J_{1}=J_{2}=1.6 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.40 \sim 7.38(\mathrm{~m}, 4 \mathrm{H}), 7.22\left(\mathrm{dd}, J_{1}=J_{2}=7.6 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.00(\mathrm{~s}$, 2H). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 139.0,130.8,130.2,129.4,128.5,125.4,123.0$. GC-MS (EI, 70 $\mathrm{eV}), m / z=340\left(\mathrm{M}^{+},{ }^{81} \mathrm{Br}, 16\right), 338\left(\mathrm{M}^{+},{ }^{79} \mathrm{Br}+{ }^{81} \mathrm{Br}, 32\right), 336\left(\mathrm{M}^{+},{ }^{79} \mathrm{Br}, 16\right), 179(16), 178(100), 177(13), 176$ (18), 152 (11), 89 (23), 88 (22), 76 (16), 75 (10). This compound is known. ${ }^{28}$

## (E)-1,2-bis(2-bromophenyl)ethene (50q):

This compound was prepared according the general procedure $C$ from $\mathbf{4 9 q}(307 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide (144 mg, 1.5 mmol ): yield $318 \mathrm{mg}(94 \%)$; white solid; mp: $96-97{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.72\left(\mathrm{dd}, J_{1}=1.6 \mathrm{~Hz}, J_{2}=8.0 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.58\left(\mathrm{dd}, J_{1}=1.6 \mathrm{~Hz}, J_{2}=8.0 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.38(\mathrm{~s}, 2 \mathrm{H})$, $7.32(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.13\left(\mathrm{td}, J_{1}=8.0 \mathrm{~Hz}, J_{2}=1.6 \mathrm{~Hz}, 2 \mathrm{H}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 136.8$, 133.1, 130.1, 129.2, 127.7, 127.2, 124.3. GC-MS (EI, 70 eV$) m / z=340\left(\mathrm{M}^{+},{ }^{81} \mathrm{Br}, 10\right), 338\left(\mathrm{M}^{+},{ }^{79} \mathrm{Br}+{ }^{81} \mathrm{Br}\right.$, 19), $336\left(\mathrm{M}^{+},{ }^{79} \mathrm{Br}, 10\right), 179(16), 178(100), 176(16), 89(18), 88(18)$. This compound is known. ${ }^{29}$

## (E)-1,2-di(naphthalen-2-yl)ethene (50r):

This compound was prepared according the general procedure $C$ from $49 \mathrm{r}(278 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide (144 mg, 1.5 mmol ): yield $261 \mathrm{mg}(94 \%)$; brown solid; $\mathrm{mp}: 256-257{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, DMSO): $\delta(\mathrm{ppm}) 8.03(\mathrm{~b}, 2 \mathrm{H}), 7.91 \sim 7.86(\mathrm{~m}, 8 \mathrm{H}), 7.55(\mathrm{~s}, 2 \mathrm{H}), 7.50 \sim 7.44(\mathrm{~m}, 4 \mathrm{H}) . \mathrm{GC}-\mathrm{MS}(\mathrm{EI}, 70 \mathrm{eV}) \mathrm{m} / \mathrm{z}$ $=281\left([\mathrm{M}+\mathrm{H}]^{+}, 28\right), 280\left(\mathrm{M}^{+}, 100\right), 279(71), 278(31), 265(17), 207(12), 152(8), 140(14), 139(19), 132$ (12), 126 (11). This compound is known. ${ }^{30}$

## ( $E$ )-1,2-di([1,1'-biphenyl]-4-yl)ethene (50s):

This compound was prepared according the general procedure $C$ from $49 \mathrm{~s}(304 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide ( $144 \mathrm{mg}, 1.5 \mathrm{mmol}$ ): yield $319 \mathrm{mg}(96 \%)$; light yellow solid; mp: 303-306 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}$ (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.57\left(\mathrm{dd}, J_{1}=J_{2}=1.6 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.55(\mathrm{~b}, 10 \mathrm{H}), 7.39\left(\mathrm{dd}, J_{1}=J_{2}=7.2 \mathrm{~Hz}\right), 7.31 \sim 7.26(\mathrm{~m}$,

2H), $7.13(\mathrm{~s}, 2 \mathrm{H}) . \mathrm{GC}-\mathrm{MS}(\mathrm{EI}, 70 \mathrm{eV}) m / z=333\left([\mathrm{M}+\mathrm{H}]^{+}, 29\right), 332\left(\mathrm{M}^{+}, 100\right), 330(3), 317(5), 252(11), 241$ (16), 239 (10), 178 (4), 176 (3), 166 (9). This compound is known. ${ }^{31}$

## Benzophenone (51a):

This compound was prepared according the general procedure C from 49 t ( $304 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) and sodium tert-butoxide ( $144 \mathrm{mg}, 1.5 \mathrm{mmol}$ ): yield 175 mg ( $96 \%$ ); white solid; mp: $46-47{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.81 \sim 7.78(\mathrm{~m}, 4 \mathrm{H}), 7.59 \sim 7.55(\mathrm{~m}, 2 \mathrm{H}), 7.48 \sim 7.24(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $(\mathrm{ppm})$ 196.7, 137.6, 132.4, 130.0, 128.3. GC-MS (EI, 70 eV$) m / z=183\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 182\left(\mathrm{M}^{+}, 65\right), 181(11)$, 106 (11), 105 (100), 77 (83), 51 (40). This compound is known. ${ }^{32}$

## 9H-fluoren-9-one (51b):

This compound was prepared according the general procedure C from $\mathbf{4 9 u}(302 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide ( $144 \mathrm{mg}, 1.5 \mathrm{mmol}$ ): yield 175 mg ( $97 \%$ ); yellow solid; mp: $83-84{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.64(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.50 \sim 7.44(\mathrm{~m}, 4 \mathrm{H}), 7.29 \sim 7.24(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right):$ $\delta(\mathrm{ppm}) 193.9,144.4,134.7,134.5,129.1,124.3,120.3$. GC-MS (EI, 70 eV$) m / z=181\left([\mathrm{M}+\mathrm{H}]^{+}, 14\right), 180\left(\mathrm{M}^{+}\right.$, 100), 152 (47), 151 (24), 150 (15), 126 (8), 76 (19), 63 (10). This compound is known. ${ }^{32}$

## Acetophenone (51c):

This compound was prepared according the general procedure C from $\mathbf{4 9 v}(242 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide ( $144 \mathrm{mg}, 1.5 \mathrm{mmol}$ ): yield $114 \mathrm{mg}(95 \%)$; colorless liquid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$
$7.91\left(\mathrm{dd}, J_{1}=1.2 \mathrm{~Hz}, J_{2}=8.0 \mathrm{~Hz}, 2 \mathrm{H}\right), 7.52 \sim 7.48(\mathrm{~m}, 1 \mathrm{H}), 7.42 \sim 7.38(\mathrm{~m}, 2 \mathrm{H}), 2.54(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}(100$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 197.9,136.9,132.9,128.4,128.1,26.4$. GC-MS (EI, 70 eV$) \mathrm{m} / \mathrm{z}=121\left([\mathrm{M}+\mathrm{H}]^{+}, 4\right)$, $120\left(\mathrm{M}^{+}, 51\right), 105(100), 77(91), 51(41)$. This compound is known. ${ }^{33}$

## Methyl 2-oxo-2-phenylacetate (51d):

This compound was prepared according the general procedure C from $\mathbf{4 9 w}(286 \mathrm{mg}, 1.0 \mathrm{mmol})$ and sodium tert-butoxide ( $144 \mathrm{mg}, 1.5 \mathrm{mmol}$ ): yield $157 \mathrm{mg}(96 \%)$; colorless liquid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ 8.01~7.99 (m, 2H), 7.67~7.63 (m, 1H), 7.52~7.48 (m, 2H), $3.97(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ 186.0, 164.0, 135.0, 132.4, 130.1, 128.9, 52.8. GC-MS (EI, 70 eV ) $m / z=105\left(\mathrm{M}^{+}-\mathrm{CO}_{2} \mathrm{Me}, 100\right), 77(62), 51$ (26). This compound is known. ${ }^{33}$
(1-hydroperoxybutyl)diphenylphosphine oxide (52a):

To a solution of $\mathbf{4 9 x}(258.3 \mathrm{mg}, 1.0 \mathrm{mmol})$ in THF $(1.0 \mathrm{~mL})$ was added $n-\operatorname{BuLi}(1.5 \mathrm{mmol}, 937.5 \mu \mathrm{~L}, 1.6$ $\mathrm{mol} / \mathrm{L}$ in hexane) at $-78{ }^{\circ} \mathrm{C}$ under Ar. The reaction mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 30 min . After then, the reaction mixture was degassed under vacuum and purged with $\mathrm{O}_{2}$ several times, and then stirred under $\mathrm{O}_{2}$ balloon at $-78^{\circ} \mathrm{C}$ for 8 h . The reaction mixture was quenched with water ( 1 mL ) and extracted with EtOAc (3 $\times 2 \mathrm{~mL}$ ). The combined organic layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ filtered and concentrated under vacuum. The crude product was purified by GPC to get 52a ( $92.8 \mathrm{mg}, 32 \%$ ). White solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm}) 7.83 \sim 7.73(\mathrm{~m}, 4 \mathrm{H}), 7.55 \sim 7.39(\mathrm{~m}, 6 \mathrm{H}), 4.85 \sim 4.80(\mathrm{~m}, 1 \mathrm{H}), 1.72 \sim 1.55(\mathrm{~m}, 3 \mathrm{H})$, $1.48 \sim 1.39(\mathrm{~m}, 1 \mathrm{H}), 0.83(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) \delta(\mathrm{ppm}) 132.3(\mathrm{~d}, J=2.9 \mathrm{~Hz}), 132.3$ (d, $J=2.9 \mathrm{~Hz}), 131.7(\mathrm{~d}, J=9.5 \mathrm{~Hz}), 131.7(\mathrm{~d}, J=9.5 \mathrm{~Hz}), 130.5(\mathrm{~d}, J=95.3 \mathrm{H}), 129.7(\mathrm{~d}, J=95.3 \mathrm{~Hz}), 128.6$ $(\mathrm{d}, J=11.4 \mathrm{~Hz}), 128.6(\mathrm{~d}, J=11.4 \mathrm{~Hz}), 84.2(\mathrm{~d}, J=79.1 \mathrm{~Hz}), 30.7(\mathrm{~d}, J=3.9 \mathrm{~Hz}), 19.8(\mathrm{~d}, J=10.5 \mathrm{~Hz}), 13.8$.
${ }^{31} \mathrm{P}-\mathrm{NMR}\left(162 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta(\mathrm{ppm})$ 33.32. MS (EI, 70 eV$) \mathrm{m} / \mathrm{z}=217$ (18), 202 (49), 201 (46), 155 (11), 77 (33), 72 (100), 71 (13), 57 (47), 51 (19). Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{O}_{3} \mathrm{P}$ (291.10): C, 66.20; H, 6.60; O, 16.53; P, 10.67. Found: C, 66.17; H, 6.56.

## Chapter 6. Conclusions

In conclusion, the hydrophosphorylation of alkenes and alkynes, with a variety of hydrogen phosphoryl compounds under metal-free conditions has been studied, and the corresponding adducts were obtained in moderate to excellent yields. The value of those approach relies on its high atom economy and easy isolation of the products. In addition, a convenient method for the preparation of symmetrical trans-stilbenes through oxidative dephosphorylation of benzylphosphonates was also disclosed.

In chapter 2 , an efficiently method for the hydrophosphorylation of alkenes with $\mathrm{P}(\mathrm{O})-\mathrm{H}$ compound generating 1 to 1 adducts and 1 to 2 adducts in high total yields has developed. The 1 to 1 adducts could be generated selectively in high yield by carrying out the reaction in $t-\mathrm{BuOH}$. The conditions that provides both of 1 to 1 and 1 to 2 adduct was applied. Based on several control experiments, a tentative reaction mechanism was proposed.

In chapter 3, I investigated the photo-initiated and radical initiator induced addition of hydrogen-phosphine oxides and related compounds to alkynes. Under UV irradiation, alkenylphosphine oxides as $Z$-and $E$-isomer mixture was obtained in moderated to high yield form the addition of H-phosphine oxides to terminal alkynes. Moderate yield of oct-1-en-1-yldiphenylphosphine oxide could be generated with high $Z / E$ selectivity form the radical initiator induced addition at low temperature. On the basis of the experimental results and previous report, a possible mechanism for this radical induced addition was proposed.

In chapter 4, a very convenient way for the synthesis of symmetrical trans-stilbene form oxidative dephosphorylation of benzylic phosphonates with oxygen has studied. The reaction took place highly stereoselectively since no cis-stilbene could be detected by FID-GC and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ in all cases. The feature of this reaction is the good compatible with a wide range of functional groups. A possible oxidative dephosphorylation coupling reaction mechanism was proposed. The peroxide intermediate was confirmed by the successful isolation of (1hydroperoxybutyl) diphenylphosphine oxide. In addition, the corresponding ketones were obtained in high yield from $\alpha$-substituted benzyl phosphonates.

## Acknowledgements

The studies described in this thesis have been performed under the direction of Professor Li-Biao Han at the Division of Chemistry, Faculty of Pure and Applied Sciences, University of Tsukuba, from October 2015 to September 2018.

I would like to express my deepest appreciation to Professor Li-Biao Han for his great support, valuable suggestions, experiment guidance and hearty encouragement throughout this work. His advice on research attitude as well as research content have been invaluable. I would like to express my deep gratitude to Associate Professor Tieqiao Chen for the helpful discussion and experimental guidance during the course of study.

I wish to thank the member of Han laboratory. Dr. Aya Yoshimura, Dr. Haiqing Guo and Dr. Yuta Saga are appreciated for their technical advices and helpful suggestions. I would like to express my thanks to Dr. Chunya Li and Dr. Jing Xiao for helpful suggestions and kind assistance. Ms. Michiyo Yoshinaga, Mr. Daoqing Han and Ms. Yu Murakami are acknowledged for their helpful assistance and dedication.

I am grateful to the Chinese Government Graduate Student Overseas Study Program (CGGSOS program) sponsored by China Scholarship Council (CSC) for the research fellowship.

Finally, I wish to express my deepest gratitude to my parent, Yuhua Huang and Shuixiu Ouyang, and my sisters, Chundi Huang, Jiadi Huang and Xiaoli Huang, and my wife, Hongmei Cao, for their kindly continuous encouragement and for providing a very comfortable environment, which allows me to concentrate on research.

July 2018

[^0]:    ${ }^{a}$ Reactions conditions: a mixture of 44a and 45a was sealed in a Pyrex-tube under dry nitrogen atmosphere and irradiated using a high-pressure Hg lamp (Ushio, SX-U1501HQ). ${ }^{6}$ Yield was calculated based on the less employed starting material. ${ }^{b}$ The yield of $\mathbf{4 6 a}$ and the $Z / E$ ratio were determined by GC. ${ }^{c}$ The yield of $\mathbf{4 7 a}$ was calculated from ${ }^{31} \mathrm{P}$ NMR spectroscopies. ${ }^{d} 3 \mathrm{~h} .{ }^{e} 2 \mathrm{~h} .{ }^{f} 6 \mathrm{~h} .{ }^{g}$ Sealed under dry air atmosphere.
