

ON THE MULTIPLICATIVE PARTITION FUNCTION

By

Ryuji KANEIWA

1. Introduction.

Let n be a positive integer. A *multiplicative partition* of the number n is a representation of n as the product of any number of integers that are greater than 1. Thus

$$24 = 2 \cdot 12 = 3 \cdot 8 = 4 \cdot 6 = 2 \cdot 2 \cdot 6 = 2 \cdot 3 \cdot 4 = 2 \cdot 2 \cdot 2 \cdot 3$$

has 7 multiplicative partitions (cf. the table annexed at the end of this paper). Let us denote the number of mutiplicative partitions of n by $X(n)$, namely

$$X(n) = \sum_{n=2^{l_2} 3^{l_3} 4^{l_4} \dots l_2, l_3, l_4, \dots \geq 0} 1 \quad (n > 1);$$

$X(1)$ is defined to be 1. This arithmetical function, we call it the multiplication partition function, was introduced by MacMahon [6] who noted that the function $X(n)$ has a generating function

$$(1) \quad G(s) = \sum_{n=1}^{\infty} X(n) n^{-s} = \prod_{m=2}^{\infty} (1 - m^{-s})^{-1}, \quad \operatorname{Re} s > 1.$$

Making use of this relation, Oppenheim [7], [8] found an asymptotic formula

$$\sum_{n \leq x} X(n) = \frac{x e^{2\sqrt{\log x}}}{2\sqrt{\pi(\log x)^{3/4}}} \left\{ 1 + \sum_{k=1}^{N-1} \frac{\varepsilon_k}{(\log x)^{k/2}} + O_N \left(\frac{1}{(\log x)^{N/2}} \right) \right\},$$

where the ε_k are certain constants, for each N and all large x . He also obtained a better approximation

$$(2) \quad \sum_{n \leq x} X(n) = x \sum_{k=0}^{\infty} d_k \frac{I_{k+1}(2\sqrt{\log x})}{\sqrt{\log x}^{k+1}} + O \left(x \frac{e^{\sqrt{\log x}}}{(\log x)^{3/8}} \right)$$

to the sum $\sum_{n \leq x} X(n)$, where the $I_k(x)$ are modified Bessel functions, and the numbers d_k are the coefficients in the Taylor expansion

$$(3) \quad \frac{G(s)}{s} e^{-1/(s-1)} = \sum_{k=0}^{\infty} d_k (s-1)^k, \quad |s-1| < \frac{1}{2}.$$

Received June 20, 1983.

In this note, we shall prove (2) with sharper error term. This is the following

THEOREM. *We have*

$$(4) \quad \sum_{n \leq x} X(n) = x \sum_{k=0}^{\infty} d_k \frac{J_{k+1}(2\sqrt{\log x})}{\sqrt{\log x}} + O(x e^{-A\sqrt{\log x}}),$$

for any positive A , and sufficiently large $x \geq x_0(A)$.

Concerning the function $G(s)$, we have immediately

$$(5) \quad \log G(s) = \sum_{m=2}^{\infty} \sum_{k=1}^{\infty} \frac{1}{k} m^{-ks} = \sum_{k=1}^{\infty} \frac{1}{k} \{\zeta(ks) - 1\}, \quad \operatorname{Re} s > 1,$$

where $\zeta(s)$ is the Riemann zeta-function. This last series converges uniformly in any compact subset of the set $\{s ; \operatorname{Re} s > 0\} - \{1, 1/2, 1/3, \dots\}$. The following lemma is due to Oppenheim [8].

LEMMA 1. *The function $\log G(s)$ is regular for $s > 0$ except $s = 1/n$ ($n = 1, 2, \dots$), where there are simple poles of the function with respective residues $1/n^2$ ($n = 1, 2, \dots$). In particular, near the point $s = 1$, we have*

$$(6) \quad \log G(s) = \frac{1}{s-1} + O(s-1).$$

By this lemma, we get the Taylor expansion (3) with

$$(7) \quad d_0 = 1.$$

Moreover Estermann [3] showed that *the function $G(s)$ is singular at every point of the imaginary axis*.

In order to prove our theorem, in the next section we shall estimate the function

$$(8) \quad \hat{\xi}_1(x) = \sum_{n \leq x} X(n)(x-n) = \int_1^x \xi_0(u) du, \quad \text{where } \xi_0(x) = \sum_{n \leq x} X(n),$$

using the theorem of Hardy and Littlewood (see Chandrasekharan [2]) that

$$(9) \quad \zeta(s) = O\left(t^{t(1-\sigma)/\log(1/(1-\sigma))} \frac{\log t}{\log \log t}\right),$$

for $t \geq 3$, uniformly for $63/64 \leq \sigma < 1$, where $\sigma = \operatorname{Re} s$ and $t = \operatorname{Im} s$. This argument will lead us our estimate (4) of $\xi_0(x)$ in §3. Finally in §4, we shall give the numbers d_k in the Taylor expansion (3) an effective form.

2. Estimation of $\xi_1(x)$.

By Perron's formula, we have

$$(10) \quad \xi_1(x) = \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} \frac{G(s)x^{s+1}}{s(s+1)} ds \quad (c > 1).$$

It is plain that

$$\sum_{k=2}^{\infty} \frac{1}{k} \{ \zeta(k s) - 1 \} = O(1)$$

for $\sigma = \operatorname{Re} s \geq 2/3$ and all $t = \operatorname{Im} s$. By (5) we have

$$(11) \quad \log G(s) = \zeta(s) + O(1) \quad (\sigma \geq 2/3).$$

Let A_1 be any fixed positive number. From (9) we get that for $t \geq 3$,

$$\zeta(s) = O_{A_1}\left(\frac{\log t}{\log \log t}\right)$$

uniformly for $1 - \frac{A_1}{\log t} \leq \sigma \leq 1$. Thus in the region $t \geq 3$, $1 - \frac{A_1}{\log t} \leq \sigma \leq 1$, $2/3 \leq \sigma$ we have

$$(12) \quad \log G(s) = O_{A_1}\left(\frac{\log t}{\log \log t}\right).$$

On the other hand for $\sigma \geq 1$, $t \geq 1$, we have

$$(13) \quad \begin{aligned} |\log G(s)| &\leq |\zeta(s)| + O(1) \\ &\leq \log t + O(1) \quad (\text{see [2] p. 34}). \end{aligned}$$

We now choose, for given $x > 1$, the curve $\mathcal{C} = \mathcal{C}_1 \cup \mathcal{C}_2 \cup \mathcal{C}_3$ such that

$$\left\{ \begin{array}{l} \mathcal{C}_1 = \left\{ s ; \sigma = 1 - \frac{A_1}{\log |t|}, -\infty < t \leq t_0 \right\}, \\ \mathcal{C}_2 = \left\{ s ; \sigma = \sigma_0, |t| \leq t_0 \right\}, \\ \mathcal{C}_3 = \left\{ s ; \sigma = 1 - \frac{A_1}{\log t}, t_0 \leq t < \infty \right\}, \end{array} \right.$$

where

$$t_0 = t_0(x) = e^{\sqrt{A_1 \log x}}, \quad \sigma_0 = 1 - \frac{A_1}{\log t_0}.$$

The curve \mathcal{C} is oriented by the parameter t . By (10), (12) and (13), we obtain

$$(14) \quad \xi_1(x) = \operatorname{Res}_{s=1} \frac{G(s)x^{s+1}}{s(s+1)} + \frac{1}{2\pi i} \int_{\mathcal{C}} \frac{G(s)x^{s+1}}{s(s+1)} ds.$$

We divide the integral on the right-hand side into several parts. Let

$$(15) \quad \frac{1}{2\pi i} \int_C \frac{G(s)x^{s+1}}{s(s+1)} ds = E_1 + E_2 + \bar{E}_2 + E_3 + \bar{E}_3,$$

where

$$E_1 = \frac{1}{2\pi} \int_{-3}^3 \frac{G(s)x^{s+1}}{s(s+1)} dt \quad (s = \sigma_0 + it),$$

$$E_2 = \frac{1}{2\pi} \int_{3^+}^{t_0} \frac{G(s)x^{s+1}}{s(s+1)} dt \quad (s = \sigma_0 + it),$$

$$E_3 = \frac{1}{2\pi i} \int_{C_3} \frac{G(s)x^{s+1}}{s(s+1)} ds,$$

and \bar{E}_j ($j=2, 3$) are complex conjugates of E_j .

(i) Estimation of E_1 . Let $s = \sigma_0 + it$ ($|t| \leq 3$). By lemma 1 we have

$$\log G(s) = \frac{1}{s-1} + O(1),$$

$$\operatorname{Re} \log G(s) = \frac{\sigma_0 - 1}{(\sigma_0 - 1)^2 + t^2} + O(1).$$

Since $\sigma_0 - 1 < 0$, $G(s) = O(1)$. Thus we have for $x > 1$,

$$(16) \quad E_1 = O(x^{\sigma_0+1}) = O(x^2 e^{-\sqrt{A_1 \log x}}).$$

(ii) Estimation of E_2 . Let $s = \sigma_0 + it$ ($3 \leq t \leq t_0$). From (9), for sufficiently large $x \geq x_1(A_1)$ we have

$$\begin{aligned} \zeta(s) &= O\left\{\exp\left(\frac{4A_1}{\log \log t_0 - \log A_1}\right)\frac{\log t}{\log \log t}\right\} \\ &= O\left(\frac{\log t}{\log \log t}\right) = O\left(\frac{\log t_0}{\log \log t_0}\right) \\ &= O\left(\frac{\sqrt{A_1}}{\log A_1} \sqrt{\log x}\right) \end{aligned}$$

By (11), we get

$$E_2 = O\left(x^2 \exp\left\{-\left(1 + O\left(\frac{1}{\log A_1}\right)\right) \sqrt{A_1 \log x}\right\}\right).$$

Thus we have for sufficiently large A_1 and $x \geq x_1(A_1)$,

$$(17) \quad E_2 = O\left(x^2 e^{-\frac{1}{2} \sqrt{A_1 \log x}}\right).$$

(iii) Estimation of E_3 . Let $\sigma = 1 - \frac{A_1}{\log t}$ ($t \geq t_0$). The estimate (12) leads us to

$$(18) \quad E_s = O\left(x^2 \int_{t_0}^{\infty} t^{-3/2} dt\right) \\ = O\left(x^2 e^{-\frac{1}{2}\sqrt{A_1 \log x}}\right)$$

for sufficiently large $x \geq x_2(A_1)$. By (14)–(18), we obtain the following

LEMMA 2.

$$(19) \quad \xi_1(x) = \operatorname{Res}_{s=1} \frac{G(s)x^{s+1}}{s(s+1)} + O(x^2 e^{-A_2 \sqrt{\log x}}),$$

for any positive A_2 and sufficiently large $x \geq x_3(A_2)$.

3. Proof of the theorem.

Let

$$(20) \quad U(x) \stackrel{\text{def}}{=} \operatorname{Res}_{s=1} \frac{G(s)x^{s+1}}{s(s+1)}.$$

Then we have

$$(21) \quad U'(x) = \operatorname{Res}_{s=1} \frac{G(s)x^s}{s}, \quad U''(x) = \operatorname{Res}_{s=1} G(s)x^{s-1}.$$

Since $\xi_0(x)$ is an increasing function, we have

$$\frac{1}{h} \{ \xi_1(x) - \xi_1(x-h) \} \leq \xi_0(x) \leq \frac{1}{h} \{ \xi_1(x+h) - \xi_1(x) \}, \quad h > 0,$$

by the definition (8). Suppose that

$$(22) \quad h = h(x) > 0, \quad h = o(x).$$

Then, by (19) we have

$$\xi_1(x \pm h) = U(x \pm h) + O(x^2 e^{-A_1 \sqrt{\log x}})$$

and

$$U(x \pm h) = U(x) \pm h U'(x) + \frac{h^2}{2} U''(x \pm \theta_{\pm} h), \quad 0 < \theta_{\pm} < 1.$$

Since

$$\pm \frac{1}{h} \{ \xi_1(x \pm h) - \xi_1(x) \} = U'(x) \pm \frac{h}{2} U''(x \pm \theta_{\pm} h) + O\left(\frac{x^2}{h} e^{-A_2 \sqrt{\log x}}\right),$$

we have

$$(23) \quad \xi_0(x) = U'(x) + O\{h U''(x \pm \theta_{\pm} h)\} + O\left(\frac{x^2}{h} e^{-A_2 \sqrt{\log x}}\right).$$

In connection with functions $U'(x)$, $U''(x)$, we can show

LEMMA 3.

$$(24) \quad U'(x) = x \sum_{k=0}^{\infty} d_k \frac{I_{k+1}(2\sqrt{\log x})}{(\log x)^{(k+1)/2}},$$

$$(25) \quad U''(x) \sim \frac{1}{2\sqrt{\pi}} \cdot \frac{e^{2\sqrt{\log x}}}{(\log x)^{3/4}}.$$

PROOF. By the definition of modified Bessel functions $I_n(x)$, we have

$$\begin{aligned} e^{\frac{1}{s-1}} x^{s-1} &= \exp \left\{ \sqrt{\log x} \left(\frac{1}{(s-1)\sqrt{\log x}} + (s-1)\sqrt{\log x} \right) \right\} \\ &= \sum_{n=-\infty}^{\infty} I_n(2\sqrt{\log x}) \{(s-1)\sqrt{\log x}\}^n \end{aligned}$$

and

$$\begin{aligned} (26) \quad \text{Res } e^{1/(s-1)} x^{s-1} (s-1)^k &= I_{-k-1}(2\sqrt{\log x}) \sqrt{\log x}^{-k-1} \\ &= \frac{I_{k+1}(2\sqrt{\log x})}{(\log x)^{(k+1)/2}}. \end{aligned}$$

By (3) and (21), we get (24). Next we shall show (25). Let c_k be the constants such that

$$G(s)e^{-1/(s-1)} = \sum_{k=0}^{\infty} c_k (s-1)^k, \quad |s-1| < 1/2$$

(cf. Lemma 1). Then for some positive constant M ,

$$|c_k| \leq M^k \quad (k=0, 1, 2, \dots)$$

and we have

$$c_0 = 1.$$

By (21) and (26), we have

$$U''(x) = \frac{I_1(2\sqrt{\log x})}{\sqrt{\log x}} + E,$$

where

$$E = \frac{1}{2\pi i} \int_{|s|=\rho} e^{1/s} x^s \sum_{k=1}^{\infty} c_k s^k ds \quad (0 < \rho < 1/2).$$

If $M\rho < 1$, we have

$$|E| \leq \frac{M\rho^2}{1-M\rho} e^{1/\rho} x^\rho.$$

By taking $\rho = 1/\sqrt{\log x}$, we obtain

$$U''(x) = \frac{I_1(2\sqrt{\log x})}{\sqrt{\log x}} + O\left(\frac{e^{2\sqrt{\log x}}}{\log x}\right).$$

Since we have, as is well known,

$$I_k(x) \sim \frac{e^x}{\sqrt{2\pi}x},$$

we get (25). This completes the proof.

By using this lemma with

$$h = x e^{-((A_{2/2})+1)\sqrt{\log x}} \quad (\text{see (22)})$$

(23) leads us to

$$\xi_0(x) = x \sum_{k=0}^{\infty} d_k \frac{I_{k+1}(2\sqrt{\log x})}{(\log x)^{(k+1)/2}} + O(x e^{-((A_{2/2})-1)\sqrt{\log x}}).$$

Thus our theorem is proved.

REMARK. In our approximation (4), we may conjecture that the best order of the error term would be

$$O\left(\sqrt{x} \frac{e^{\sqrt{\log x}}}{(\log x)^{3/4}}\right),$$

for the reason that

$$\begin{aligned} \text{Res}_{s=1/2} \frac{G(s)x^s}{s} &= \sqrt{x} \sum_{k=0}^{\infty} d'_k \frac{I_{k+1}(\sqrt{\log x})}{2^{k+1}(\log x)^{(k+1)/2}} \\ &\sim \frac{d'_0}{2\sqrt{2\pi}} \sqrt{x} \frac{e^{\sqrt{\log x}}}{(\log x)^{3/4}}, \end{aligned}$$

where d'_k are defined by

$$\frac{G(s)}{s} e^{-\frac{1}{4(s-(1/2))}} = \sum_{k=0}^{\infty} d'_k \left(s - \frac{1}{2}\right)^k \quad \left(\left|s - \frac{1}{2}\right| < \frac{1}{6}\right).$$

However, it seems very difficult to prove this.

4. The numbers d_k .

Let γ_n and α_n respectively denote the constants defined by

$$(27) \quad \gamma_n = \lim_{N \rightarrow \infty} \left(\sum_{\nu=1}^N \frac{\log^n \nu}{\nu} - \frac{\log^{n+1} N}{n+1} \right) \quad (n \geq 0)$$

and

$$(28) \quad \alpha_n = \sum_{m=1}^n (m-1)! S(n, m) \alpha_n^{(m)} \quad (n > 0),$$

where

$$\alpha_n^{(m)} = \begin{cases} \sum_{\nu=1}^{\infty} \frac{\log^n(\nu+1)}{\nu(\nu+1)}, & \text{if } m=1, \\ \sum_{\nu=1}^{\infty} \frac{\log^n(\nu+1)}{\nu^m}, & \text{if } m>1, \end{cases}$$

and integers $S(n, m)$ are Stirling numbers of the second kind, that is, defined by the identity

$$(29) \quad x^n = \sum_{m=0}^n S(n, m) x(x-1) \cdots (x-m+1).$$

Then we have the following

PROPOSITION. *The numbers d_n can be represented in the form*

$$(30) \quad d_n = (-1)^n \sum_{m=0}^n \sum_{\substack{m_1+m_2+\dots=m \\ m_1, m_2, \dots \geq 0}} \frac{\beta_1^{m_1} \beta_2^{m_2} \dots}{(1!)^{m_1} m_1! (2!)^{m_2} m_2! \dots},$$

where $\beta_n = \gamma_n + \alpha_n$ ($n > 0$).

Thus we have

$$d_0 = 1,$$

$$d_1 = -1 - \beta_1 = -2.18493 \dots,$$

$$d_2 = 1 + \beta_1 + \frac{1}{2}(\beta_2 + \beta_1^2) = 5.48422 \dots,$$

$$d_3 = -1 - \beta_1 - \frac{1}{2}(\beta_2 + \beta_1^2) - \frac{1}{6}(\beta_3 + 3\beta_2\beta_1 + \beta_1^3) = -13.80378 \dots,$$

.....

PROOF OF PROPOSITION. It is not difficult to see that β_n and γ_n can be defined alternatively by

$$(31) \quad \log G(s) = \frac{1}{s-1} + \sum_{n=1}^{\infty} \frac{(-1)^n}{n!} \beta_n (s-1)^n$$

and

$$(32) \quad \zeta(s) = \frac{1}{s-1} + \sum_{n=0}^{\infty} \frac{(-1)^n}{n!} \gamma_n (s-1)^n$$

respectively. We obviously get (30) from (31). And also we have (27) from (32). The latter was found by Stieltjes, Jensen [5], and Briggs-Chowla [1]. Values $(-1)^n \gamma_n / n!$ have been calculated by Gram [4] with 16 decimals. We now have

$$\beta_n = \gamma_n + \alpha_n \quad (n > 0),$$

where

$$(33) \quad \alpha_n = (-1)^n \sum_{k=2}^{\infty} k^{n-1} \zeta^{(n)}(k) = \sum_{\nu=1}^{\infty} \log^n \nu \sum_{k=2}^{\infty} k^{n-1} \nu^{-k},$$

by (5), (31) and (32). It is enough to show (28) from the definition (33) of α_n . We have

$$\sum_{m=1}^n (m-1)! S(n, m) \alpha_n^{(m)} = \sum_{\nu=1}^{\infty} \log^n (\nu+1) \left\{ \frac{1}{\nu(\nu+1)} + \sum_{m=2}^n (m-1)! S(n, m) \nu^{-m} \right\}$$

We may show, for all positive integers ν ,

$$(34) \quad \sum_{k=2}^{\infty} k^{n-1} (\nu+1)^{-k} = \frac{1}{\nu(\nu+1)} + \sum_{m=2}^n (m-1)! S(n, m) \nu^{-m}.$$

This leads us to (28). Let $f_n(w)$ ($n=1, 2, \dots$) denote rational functions

$$\frac{w^2}{1+w} + \sum_{m=1}^n (m-1)! S(n, m) w^m,$$

and suppose $S(n, m)=0$ for integers m outside $0 \leq m \leq n$. If $w=z/(1-z)$ then we have

$$\begin{aligned} f_n(w) &= \frac{z^2}{1-z} + \sum_{m=2}^n (m-1)! S(n, m) (z+z^2+\dots)^m \\ &= \sum_{k=2}^{\infty} z^k \sum_{m=1}^k (m-1)! S(n, m) \frac{m(m+1)\cdots(k-1)}{(k-m)!} \\ &= \sum_{k=2}^{\infty} z^k \frac{1}{k} \sum_{m=1}^n S(n, m) k(k-1)\cdots(k-m+1) \\ &= \sum_{k=2}^{\infty} k z^{n-1} z^k \quad (|z|<1), \end{aligned}$$

by (29). Thus we have (34), on putting $w=1/\nu$. This completes the proof.

REMARK. The author could not find Stieltjes's paper for γ_n , whereas Gram [4] referred to it.

ACKNOWLEDGEMENT. The author wishes to thank Prof. S. Uchiyama, Prof. T. Tatuzawa and Mr. S. Egami for valuable advice.
