

# Wetter subtropics and Hadley/Walker circulation in mid-Pliocene simulated by an atmospheric general circulation model

\* Kamae, Y<sup>1</sup>., H. Ueda<sup>1</sup>, A. Kitoh<sup>2</sup>

<sup>1</sup>Graduate School of Life and Environmental Sciences, Univ. Tsukuba

<sup>2</sup>Meteorological Research Institute

**Middle Pliocene (3Ma)** • most recent sustained warm period  
• land-sea distribution is near to the present  
  
Intensification of Gulf stream → water vapor transport → high latitude glaciation  
Global cooling & drying  
Formation of the western Pacific warm pool & eastern Pacific cooling

## Model

**AGCM** in MRI-CGCM2.3.2 Yukimoto et al. (2001, 2006)

T42L30 (~280km grid)

land process 3-layer SIB (Sellers et al. 1986)  
convection scheme prognostic Arakawa-Schubert (Randall and Pan 1993)  
planetary boundary layer Mellor-Yamada level 2 (Mellor and Yamada 1974)

## Experimental design

"Experiment 1" in PlioMIP Haywood et al. (2010)		
run	0Ma	3Ma
CO <sub>2</sub>	280ppmv	405ppmv
CH <sub>4</sub>	760ppbv	760ppbv
N <sub>2</sub> O	270ppbv	270ppbv
SST, sea ice	Dowsett et al. 2009	
Topography	Sohl et al. 2009	
Vegetation	Salzmann et al. 2008	
	No change in orbital forcing and land-sea distribution	
	Spin-up: 10 years	
	Integration: 50 years	

## Boundary condition

USGS PRISM3 U.S. Geological Survey Pliocene Research, Interpretation and Synoptic Mapping Project

Marine: 86 sites Land: 202 sites

Salzmann et al. 2008

Vegetation 0Ma

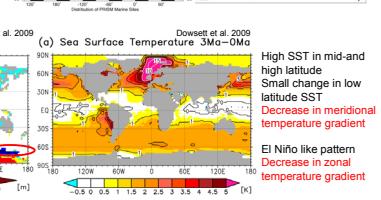

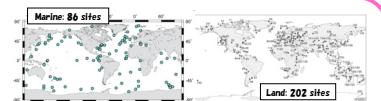

Vegetation 3Ma

Topography 3Ma–0Ma

Sea Surface Temperature 3Ma–0Ma

High SST in mid-and high latitude  
Small change in low latitude SST  
Decrease in meridional temperature gradient

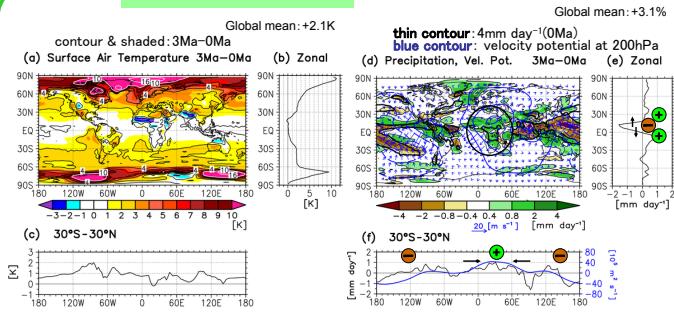

El Niño like pattern  
Decrease in zonal temperature gradient

## Purpose

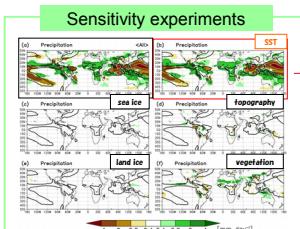

simulating atmospheric general circulation and hydrological cycle with boundary conditions reconstructed by proxy data

## Results

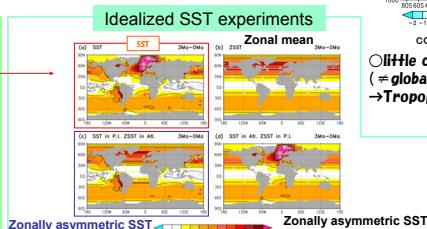

- Mid- and high latitude: high SST + ice albedo feedback
- Low latitude: little change

○ Weakening and expansion of ITCZ  
○ Wetter condition over the subtropics (Sahara, Australian desert)

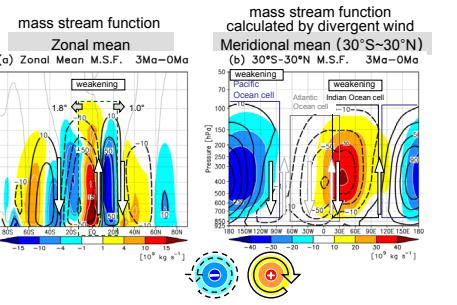

○ SST is the main factor (in low-latitude)

○ Zonally asymmetric SST pattern in the Indian / Pacific Ocean → east-west atmospheric circulation (Warm SST in upwelling region)

Simulated vegetation by BIOME4

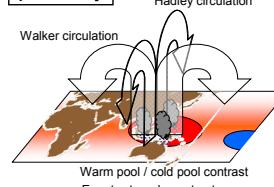

○ Weakening of Hadley cells  
○ Boundaries of cells shift poleward ↑ small equator-pole SST contrast in tropics

○ Weakening of Walker circulation  
○ Small west-east SST contrast in tropics

## Summary

present day

mid-Pliocene
