(Accepted Dec. 28, 1989)

### Synopsis

We give a preliminary list of aquatic insects of an acidic stream, the Daimyojin-zawa, and a neutral one, the Naka-no-sawa in Sugadaira. The numbers of collected species from the Daimyojin-zawa and the Naka-no-sawa are 34 and 61, respectively, including many species hitherto unrecorded in these streams.

Key words : Fauna, aquatic insect, acidic stream, neutral stream, Central Japan.

The aquatic insect fauna of an unusually acidic stream in Sugadaira, the Daimyojin-zawa has been examined, in comparison with that of neutral ones in the same area (NEGORO, 1938; IDE, 1954; HIROSE, 1961; YOSHIDA, 1967). Our knowledge on the fauna of Daimyojin-zawa is, however, still insufficient, and we accordingly attempted to reexamine it. Adding to the Daimyojin-zawa, a neutral one, the Naka-no-sawa, which is close and substantially identical in size and features to the former, was selected for comparison. Here, we give a preliminary list of aquatic insects of these two streams.

The sampling site in the Daimyojin-zawa was selected in the Sugadaira Montane Research Center, University of Tsukuba (1250-1300m alt.). The site in the Naka-no-sawa was also set up at the substantially the same height along the stream. Surveys were made four times in the former, three times in the latter in the period of 1987-1988 (Table 1).

Through these surveys we could list up species nearly as twice as in previous reports.

---

\* Contributions from Sugadaira Montane Research Center, University of Tsukuba, No. 126.

Table 1. Date of survey

Daimyojin-zawa		Naka-no-sawa
Aug.	23, 1987	Aug. 24, 1987
Oct.	11, 1987 (pH 6.5)	Oct. 11, 1987 (pH 7.4)
Nov.	29, 1987	Aug. -7, 1988 (pH 7.4)
	Aug. -7, 1988 (pH 5.1)	

As shown in Table 2, we could collect 34 and 61 species in the Daimyojin-zawa and the Naka-no-sawa, respectively : a few increase of species may be expected, because some of "species" in the list may include plural forms. The species collected are categorized into three.

### 1. Species restricted to Daimyojin-zawa

Thirteen species were enumerated. Species collected more than twice of four-times surveys are as follows :

*Plectrocnemia* sp.

*Apsilochorema sutchanum*

*Parapsyche* sp. (sp. II)

*Hydrophilidae* gen. sp.

*Dicranota* sp.

### 2. Species restricted to Naka-no-sawa

Thirty-nine species were enumerated. Species collected more than twice of three-times surveys are as follows :

*Epeorus curvatus*

*Baetis sahoensis*

*Ephemerella bifurcata*

*Ephemerella cryptomeria*

*Ephemera japonica*

*Nemoura* sp.

*Yoraperla japonica*

*Calineuria stigmatica*

*Rhyacophila impar*

*Diplectrona* sp.

*Goerodes* sp.

### 3. Species common to Daimyojin-zawa and Naka-no-sawa

Twenty-one species were enumerated. Species collected more than twice of surveys in both streams are as follows :

*Baetis yamatoensis*

*Scopura montana*

*Amphinemura* sp.

*Protonemura* sp./spp.

*Chloroperlidae* gen./genr. sp./spp.

*Parapsyche* sp. (sp. I)

*Staphylinidae* gen. sp.

*Simulium japonicum*

We will continue the faunal survey of aquatic insects in Sugadaira, and our further study will ensure the precise appreciation and characterization of faunae of each stream.
